OF HIGH GRADE REFRACTORIES

## behind the scenes

### Distant Drums

Most of them were young men. They were not particularly interested in politics, or dynasties, or the balance of power. Generally, they resented authority, and cursed confusion, and complained endlessly. Usually they were dirty, and the odor that hung about them could never be confused with My Sin. When they weren't terribly frightened, they were terribly bored. Much of the time they talked about women, and home, and family meals. Sometimes they argued over the rights and responsibilities of governments, but more often than not they damned all politicians. Exposed to all the malignancies of weather in all climates and in all seasons, they qualified as experts on sunstroke, frostbite, drought, floods, and whirlwinds. They were exposed to other things, too: Fear, and disease, and the dread of death. Yes, most of these men were fundamentally reluctant, but when they accepted the authority of their government, they accepted it to the extent that they dared to surrender life itself. Perhaps not one in a million subscribed to the belief that it was sweet and lovely to die for one's country, but the solemn fact remains that multitudes did. Thinking along these lines proves nothing and reveals nothing, except that today is Veterans' Day, and if what this day stands for doesn't make you think, nothing will.

### Small Business Is Big Stuff

STEEL's Program for Management article this week (Page 99) is the last in the 1957 series. Like the stainless steel report last week (STEEL, Nov. 4, p. 107), "Small Business—Its Place in Our Future" is a community effort . . . a community of STEEL staffers, that is. In its final shape, the article is an objective report, but it also contains advice and suggestions for the small businessman. For instance, there are items on taxes, business restrictions, contracts, and detour signs around pitfalls.

In a sneak preview of this article, we learned that small business has just about doubled since 1946. That's

an interesting fact to sling in the teeth of business blues singers. Another interesting item is the volume of business done by small metalworking firms each year. It amounts to \$47 billion! The corollary to this, of course, is: If small business does this much, and is called "small," what in the world is "big business"?

### Call Backfires

Glenn W. Dietrich, STEEL's quick-eyed associate copy editor, relayed this story to us. Because Glenn sits on the fence, so to speak, with his ear to the ground, so to speak, he is in an excellent position to observe what is going on inside and outside the editorial coops. One day recently, while he was engaged in a spirited debate with himself concerning the pros and cons of placing exclamation marks inside or outside quotation marks, he chanced to overhear one side of a telephone conversation. The call, apparently, was placed with an executive, requesting a prognosis of business conditions. "Yes, sir, your opinion would be helpful. You say you'll get the information for me at once? Thank you—what's that? Pardon me, I didn't quite catch what you said. You'll what?" After a short silence, Dietrich heard a muffled exclamation, a telephone click, and a remark addressed in wondering tones to nobody in particular: "He says to wait a minute, that he'll read me his answer from 'The Business Trend' in STEEL!"

### Sputnik Flips

After you part the whiskers, you'll discover that this is another oldie. Francis Sputnik, an old poker player, was unhappy to find that his new license plate had five numerals, not in sequence, and all different. Still sputtering (probably beep, beep) he absently screwed the plate on upside down, with the result that he increased his registration number by 78,633. What was the number on Francis Sputnik's license plate?

# POP'S School of Filing

WHAT'S FUD  
GONNA DO--  
CLIMB  
MOUNTAINS?

NOPE! POP TOLD HIM  
HE WAS GONNA  
START TEACHING  
HIM HOW TO USE X.F.  
(EXTRA FINE) SWISS  
PATTERN FILES TODAY!  
NICHOLSON FOLKS MAKE  
A FILE FOR EVERY PURPOSE  
--YOU SUPPOSE HE'S  
GOT AN OUTFIT FOR  
EVERY FILING  
PURPOSE??

For precision filing and fine work, Fud can forget the leather outfit—and simply equip himself with the proper Nicholson X.F. Swiss Pattern files.

These precision files are made to extremely tight tolerances. And Nicholson makes hundreds of types so that anyone who needs a Swiss Pattern file can get exactly the type he needs with outstanding Nicholson quality.

Nicholson X.F. Swiss Pattern files have the same general shapes as American Pattern files, but you will find them thinner and more finely shaped. You can get Nicholson X.F. Swiss Pattern files in seven degrees of fineness, instead of the usual three for American Pattern files.

Your Industrial Distributor will fill your order for X.F. Swiss Pattern files promptly.

**NICHOLSON FILE COMPANY, PROVIDENCE, RHODE ISLAND**

(In Canada: Nicholson File Company of Canada Ltd., Port Hope, Ontario)

## LETTERS TO THE EDITORS

### Lauds Vivid Article

Allow me to congratulate you upon your interesting and vivid article, "Dealing with Workers" (Sept. 16, Page 119). May I have three reprints?

I look forward to reading your Program for Management series articles.

Dr. A. T. Yu  
 Chief Design Engineer  
 Robins Engineers Div.  
 Hewitt-Robins Inc.  
 New York

Please arrange to send me 1200 reprints of this article. We intend to mail them to our supervisors.

Bennett E. Kline  
 Director  
 Management Development & Training  
 Indiana Harbor Works  
 Inland Steel Co.  
 East Chicago, Ind.

### Requests Brazing Selector

Please forward a copy of the article, "Brazing Alloy Selector," (Oct. 7, Page 162), which is particularly interesting to me. It will be a valuable addition to our files.

J. F. Brownell  
 Product Design Engineer  
 Distribution Transformer Dept.  
 General Electric Co.  
 Oakland, Calif.

### Bouquet for Editorial

An orchid and a pat on the back to you for your hard-hitting editorial, "Needed: A Pricing Policy" (Sept. 30, Page 43).

We were particularly impressed by your statement on the motivation of pricing decisions for the purpose of increasing sales. To that statement, we heartily subscribe. It could spell ruin.

Arthur T. Dalton  
 Vice President  
 Chicago Wheel & Mfg. Co.  
 Chicago

### Information for Files

Please send six copies of the article, "Choose the Right Lubricant" (Oct. 14, Page 132). We found it to be informative and would like six copies for our file.

Beverley Schwendiman  
 Metallurgical Service  
 Steel Co. of Canada Ltd.  
 Hamilton, Ont.

### Parable in Newspaper

One of our readers mailed me a copy of your excellent editorial, "Parable of the Prices" (July 15, Page 51), suggesting (Please turn to Page 12)

**FOR FLEXIBILITY OF DESIGN.** In this "Cold-Zone" cooling-storage milk products tank, made by Damrow Brothers Company, Fond du Lac, Wisc., Type 304 10-gage Stainless Steel was used for the smooth, easy-to-clean inner wall. Again Stainless Steel—this time Type 304 16-gage—was used for the dimpled outer wall which is stove-welded to the inner shell. This unusual design of dimple size and arrangement gives proper baffling and velocity to the refrigerant as it passes through the cooling area. Stainless Steel provides greater sanitation, durability, long life, strength and—the flexibility necessary to make this design possible.

# NOTHING *can equal* *Stainless Steel*

*in its unique combination of properties*

No other design material can match Stainless Steel in its combination of desirable properties: corrosion resistance, strength, hardness, beauty, cleanability and easy fabrication. If you're looking for a reliable source of supply, remember that United States Steel offers you the widest range of types, finishes and sizes.

**FOR BEAUTY.** Stainless Steel shingles in diminishing sizes create a beautiful, gleaming steeple for the State Street Methodist Church in Bristol, Virginia. Architect Allen Dryden, of Kingsport, Tenn., specifies Stainless Steel for jobs like this to assure lasting beauty, protection from weather and freedom from maintenance. This spire is sheathed in Type 302 26-gage Stainless Steel, and the cross is built of Type 302 Stainless bars. Construction details were engineered by Overly Manufacturing Company, Greensburg, Pa., who also fabricated and erected the steeple.

**FOR DURABILITY.** The Master Combination Padlock, designed for school locker room use and built by Master Lock Company, Milwaukee, Wisconsin, features a double-case construction—with Type 430 Stainless Steel used for the outer case. This Stainless Steel design makes it one of the strongest padlocks available. In addition to increasing the lock's durability, Stainless Steel also adds to its sales appeal and to its resistance to the corrosive atmospheres of damp locker rooms. The springs, too, are made from USS Stainless Steel—Type 304 Ameroxide coated wire.

**Get off-the-shelf delivery on**

**CHICAGO®**

**Induction Hardened\***

**PRESS BRAKE DIES**

**27**

**Dealers Offer  
Stock Deliveries**

This country-wide organization of local dealers offers immediate delivery on many CHICAGO induction hardened press brake dies. These stock dies are economical, and the quick delivery saves time in tooling. They are available in any length from 4 to 12 feet in increments of 2 feet.

Stock dies are used for a surprisingly large variety of bending operations. And, with CHICAGO induction hardened dies you get bonus performance and increased die life at no extra cost. Remember, these dies can be used in any make or size of standard press brake.

On your needs for press brake dies, call your nearest dealer listed here. With Bulletin D-455 you can order by number. Ask for copy.

### Decision-Influencing Article

We have read with a great deal of interest the ninth article in your 1957 Program for Management, "Make or Buy?" (Oct. 14, Page 105). We feel that this well-written piece will be of help to us in reaching a "make or buy" decision. Please send five copies.

M. L. Cowan  
Materiel Manager  
Librascope Inc.  
Glendale, Calif.

We have noted this interesting article and would like to distribute it within our organization. We would appreciate six reprints.

E. G. Althoff  
Assistant Director of Purchases  
Frigidaire Div.  
General Motors Corp.  
Dayton, Ohio

We would like to have 30 copies.

Lewis Turner  
Vice President  
Dollin Corp.  
Irvington, N. J.

### Beneficial to Work

I believe your article, "Look What's Happening to Honeycombs" (Oct. 14, Page 116), would be beneficial in our work. Please send four copies.

V. D. Sanford  
Manufacturing Development  
Dept. 79  
Columbus Div.  
North American Aviation Inc.  
Columbus, Ohio

I have read this article with interest, and I would like to request two reprints.

D. E. Wernz  
Assistant Supervisor  
Mfg. Research & Development  
Martin Co.  
Baltimore

### Appreciates Help

Please send a copy of your article, "How To Be a Better Boss" (Sept. 23, Page 90). I appreciate your help and thank you for making these extra copies available.

G. A. DeWyer  
Ivanhoe Div. Engineering  
Reliance Electric & Engineering Co.  
Cleveland

### Price Rise of Interest

I found your article, "Why Prices Rise" (Sept. 30, Page 45), particularly interesting. We would appreciate several copies.

E. H. Burk  
Vice President-Mfg.  
Sterling Radiator Co. Inc.  
Westfield, Mass.

# Metalworking Outlook

## Atomic Business Slow

The atomic energy industry doesn't have enough business to keep all companies in it operating at even near capacity, Stanley B. Roboff, Sylvania-Corning Nuclear Corp., Bayside, N. Y., told the Atomic Industrial Forum in New York. He suggests this marketing program to stimulate sales:

1. Surveys and appraisals of the long and short range markets.
2. Wider contacts with all possible customers.
3. Greater capitalization on the growing overseas market.

Dr. L. L. Davenport, Sylvania-Corning president, lists other "disturbing factors" in the nuclear field: Inadequate profit, high capital requirements, skilled personnel shortage, inadequate patent protection. He advocates standardization of reactor designs, relaxation of security provisions, more reasonable tolerance in engineering and design specifications.

## Turnabout in Defense Spending?

There's little concrete evidence of a switch to a \$40 billion to \$45 billion Defense Department budget for fiscal 1959 (the \$38 billion to \$40 billion range is now in vogue), but some weathervanes in Washington point in that direction. Hints of things to come: Defense Secretary Neil McElroy's quick action on money for research and development (rescinding an order to cut R&D spending by 10 per cent) and the Air Force's announcement that it would pay bills on time. The Pentagon also reveals that current spending is \$400 million above the \$38-billion level.

## Ike's Considering It

While economy-minded forces on Capitol Hill maintain a guard hard for missile enthusiasts to break, the White House could gage public opinion this way:

1. The public doesn't want the U. S. to stay behind Russia in the headline-grabbing sputnik department.
2. Neither do our allies overseas.
3. We could get a few extra billions for defense by foregoing a tax cut, limiting social programs like school construction, reducing farm payments, and increasing postal revenues.

Some Washington observers regard Vice President Nixon's recent San Francisco speech as a test of public opinion: He hinted that tax cuts might not be possible next year because of increased defense spending.

## Missile Investigation Underway

Rep. George Mahon's (D., Tex.) Defense Appropriations Subcommittee started hearings last week at the Air Force's Ballistic Missile Div. in Inglewood, Calif. Working at the hub of our ICBM program (Ramo-Wooldridge Corp. is the Air Force's weapons system manager), the subcommittee will probably come up with the closest look Congress will get at our latest re-

# Metalworking

---

## Outlook

search in missiles. Representative Mahon is already on record as willing to give the Pentagon whatever it thinks necessary to do the job right.

### **Kefauver Will Probe Auto Prices**

Sen. Estes Kefauver (D., Tenn.) will next investigate why 1958 auto prices are higher. The Big Three of autodom have already been contacted by the Antitrust & Monopoly Subcommittee's staff. Walter Reuther will testify. The auto probe will begin this month. It'll be followed, probably, by a look at prices in the aluminum, can, roofing, and farm equipment fields.

### **GM To Start Publicity Plan on UAW Demands**

General Motors Corp. at the turn of the year will start an extensive campaign to educate its employees and the public on the problems raised by expected United Auto Worker demands for the short week, higher wages, and other issues. The program indicates a GM decision to be tough about 1958 bargaining. Labor experts around Detroit guess that GM will be the prime union target next year.

### **St. Lawrence 80% Finished**

The St. Lawrence Seaway and power project are 80 per cent complete. The Long Sault Canal, which will enable ocean-going freighters to enter the Great Lakes, will open next July, although it won't operate at full capacity until the spring of 1959 because of dredging problems.

### **ICC Would Rule on Rail Merger**

The Interstate Commerce Commission would rule on the merger of the Pennsylvania and New York Central railroads, if it's ever formally proposed. If the ICC approves, the plan would be immune from the anti-trust laws. Other railroads considering merger are the Erie, Delaware & Hudson, and Delaware, Lackawanna & Western.

### **Tool, Die Business Spotty**

Tool and die makers attending the National Tool & Die Manufacturers Association convention report: Missile business on the West Coast and in Connecticut is picking up; in Detroit and Philadelphia, work on 1959 model auto dies will start within the next 60 days (an increase of up to 30 per cent over the 1958 die business is expected). Elsewhere, layoffs and reduced workweeks are common.

### **Straws in the Wind**

About \$400 million will be spent this year by American business for consulting services . . . Industry is spending some \$130 million a year on air pollution control . . . Four out of five U. S. households have one or more television sets . . . The 1957 soft coal production will total 498 million tons, compared with 502 million in 1956.

November 11, 1957

## Satire on Retirement

The age of retirement is one of the most debatable and confusing problems of the day. As a relief from the usual treatment of the subject we recommend Prof. C. Northcote Parkinson's *Parkinson's Law*. (Houghton Mifflin Co.).

The professor finds that the age of compulsory retirement varies all over the lot—from 55 to 75, and, without exception, it is arrived at by arbitrary and unscientific methods. But he has discovered that one constant is present in all plans. Involving the time at which mental powers and energy show signs of flagging, it is expressed as R minus 3. For example, if retirement is fixed at 65, the candidate starts to slip at 62; or if the magic number is 60, slippage begins at 57.

This is an interesting fact, says the professor, but it is not helpful in deciding what R should be. The observation that some men are old at 50 and others are energetic at 80 or 90 also leads nowhere. The man to watch, says Professor Parkinson, is not the man being considered for retirement (X) but (Y), the man destined to replace him. It requires investigation of the stages a man goes through in a successful career. They are:

1. Age of Qualification = Q.
2. Age of Discretion = D(Q plus 3).
3. Age of Promotion = P(D plus 7).
4. Age of Responsibility = R(P plus 5).
5. Age of Authority = A(R plus 3).
6. Age of Achievement = AA(A plus 7).
7. Age of Distinction = DD(AA plus 9).
8. Age of Dignity = DDD(DD plus 6).
9. Age of Wisdom = W(DDD plus 3).
10. Age of Obstruction = OO(W plus 7).

The numerical value of Q is the age at which a professional or business career begins. It will be seen that if Q equals 22, X will not reach the age of obstruction until he is 72.

The problem, however, centers not on X but

on Y, his heir apparent. The professor's inquiries tend to prove that the age gap between X and Y is 15 years. Taking this average and assuming that Q equals 22, we find that Y will have reached AA at 47 when X is only 62.

That is the moment of crisis. Y is thwarted in his ambition because X still retains control. Y's career takes a new turn:

6. Age of Frustration = F(A plus 7).
7. Age of Jealousy = J(F plus 9).
8. Age of Resignation = R(J plus 4).
9. Age of Oblivion = O(R plus 5).

So when X is 72, Y is 57, just entering on the age of Resignation. Should X retire at 72, Y is quite unfit to take his place. After a decade of frustration and jealousy, he is resigned to a career of mediocrity. For Y, the opportunity is ten years too late.

The problem is to make X retire at 60 while he's still able to do the work better than anyone else. The change may be for the worse, but the alternative is to have no possible successor on tap when he finally goes.

The question is how to move X. This can be done by resorting to a custom once practiced by African tribes: That of liquidating the chief at a certain point in his career. The method depends essentially on:

1. Air travel to conferences in faraway places.
2. The filling in of forms.

Given enough of each, the professor reports, the reluctant candidate for retirement will say "uncle" posthaste.

But a serious problem remains: What to do as we approach the retirement age we've fixed for others? It becomes obvious at once that our case is different. There is no possible successor in sight. We knew how to make our predecessors retire. When it comes to forcing our own retirement, our successors must find a method of their own!

*Metalworking finds itself in a maze as . . .*

## Pattern Bargaining Spreads

"WE AGREE to negotiate a contract similar to that of General Motors Corp."

So wrote a maker of auto parts to its union representatives during the 1955 negotiations with the United Auto Workers. It's an example of pattern bargaining at its worst. At best, pattern bargaining is no bargain.

**The Pattern**—Says Kenneth B. Porter, research director for Employers Association of Detroit: "Pattern bargaining—where the union tries to apply a contract formula for all companies whose workers it represents—is definitely on the increase." Says Ken Bannon, United Auto Workers' Ford director: "Of course, we favor pattern bargaining. We're after even

more than we have now."

Two kinds of pattern bargaining predominate today, although there are modifications of each. First is the industry type as in steel or autos. Initially, the pattern was imposed just on basic steel or the Big Three auto companies. Now the unions are broadening out. United Steelworkers is trying to negotiate about 1200 contracts with metal fabricators this year so that they will expire on or about June 30, 1959—the expiration date for basic steel contracts. The strategy is obvious: Get as many as possible of the 1500 contracts in other than basic steel to expire at or near that time. It will clear the way for settlements patterned after the

pace-setting steel agreements.

The second pattern type is the common agreement for most of the diverse companies in an area. Detroit and Youngstown are examples. In the Ohio city, an electronics manufacturer, an equipment maker, and an office furniture producer have the basic steel contract, modified only slightly.

**Why the Pattern?**—Because they are political organizations, unions like the pattern. It makes bargaining easier. All, or most, members will have the same pay ranges. Most companies accept a pattern because they have to.

Autonomy of the union locals braked the growth of the trend up to World War II. Until then, local labor leaders had more power and could get the internationals to accept independent agreements tailored for local situations. But labor has centralized rapidly in the past decade. Today, among metalworking unions local autonomy is rare.

**Pattern Evils**—What problems does the pattern cause? Because of it, the Youngstown metal furniture maker pays 30 to 80 cents an hour more for its labor than most of its competitors. Holley Carburetor Co., Detroit, has labor costs 10 to 20 cents an hour higher on its aircraft volume than its competitors. The Holley case illustrates another danger in pattern bargaining. In 1955, when it signed with the United Auto Workers, 80 to 85 per cent of its volume was automotive, 15 to 20 per cent aircraft. Today, its product mix has shifted drastically—it's nearly half aircraft. But the auto-pattern contract is still in effect.

Pattern bargaining influences the choice of plant sites, too. Since the end of World War II, some 90 per cent of Ford's expansion has been outside Michigan. High Detroit area labor costs are a major reason. The pattern has even forced some companies completely out of Detroit—or out of business.

**To Break the Pattern**—What can you do about the pattern? Four approaches stand out:

1. Give in, but offset the higher costs with higher efficiency. That's the most common reaction, but it takes a lot of expensive new equipment to boost productivity commensurate with current wage increases.

2. Move out, or expand elsewhere. Many companies are doing this and finding it a solution, for the short term at least. But how long will it take the union to catch up with the new plant in Arkansas?

Answers a bicycle manufacturer who has moved his operations to the South: "Maybe the union will never be able to organize me. But let's suppose that it does. If so, I know a lot more about bargaining today than when labor organized me in the 1930s. I won't make the mistakes which have haunted me for 20 years."

3. Bargain better. That's the best of the four approaches, but also the most difficult, points out Associated Industries of Cleveland. It involves year-round study of the industrial relations situation, not just hasty attention to it for 60 days before the contract is due to expire. It involves careful preparation, using wage and other facts for your area and your industry. It requires skillful negotiators. Employers' groups like AIC can offer valuable help on

both preparation and negotiation.

If management does a good labor relations job, the pattern can be broken. General Electric Co. has demonstrated that with its policy of "going to the workers" the year round with the facts about the company and the labor situation. American Motors Corp. won an unpatterned agreement at its Milwaukee body works in 1955 because of a tough stand with the union local. Comments Edward L. Cushman, vice president for industrial relations at AMC: "As long as a union is convinced that you're not out to undermine it, you can do wonders with an honest presentation of your case."

But even with good bargaining, a small company or one in an area completely dominated by one union may have trouble breaking the pattern. Perhaps the answer is in Approach No. 4.

4. Bargain jointly with other companies. The divide-and-conquer method of bargaining is a standard union technique. In dealing with the Big Three automakers, the UAW makes clear that it will settle for a slightly more lenient package with the first company that will sign. Ford, Chrysler Corp., and AMC have all indicated they'd like to bargain jointly in 1958; GM probably doesn't want to. It believes it can bargain

better; it doesn't want to be tied to some compromise. Therein lies the problem with industry-wide bargaining (the term used when companies band together for contract negotiations). Getting all these companies to agree to pool their efforts is like trying to mix oil and water.

Coal is one of the few American industries that even approaches industry-wide bargaining, but dissenters still are numerous. Basic steel saw the three largest producers bargain simultaneously in 1956, although the actual negotiations were technically separate.

The most practical route to a united company front in labor bargaining may lie in the local approach. Many successful coalitions already operate—the tool and die shops in Detroit, 160 manufacturing and machine shops in the San Francisco area represented by California Metal Trades Association, and a group of patternmakers in Cleveland.

Last summer the 160 California plants went through a 42-day strike with the International Association of Machinists when negotiations broke down with just one of the coalition members, Dalmo Victor Co., an electronics producer. The IAM demanded 25 to 50 cents more per hour, finally had to settle for 13 to 20 cents, plus another 11 cents, and a cost of living adjustment effective July 1, 1958. Some 20 members backed out and signed separately, but they employed only 370 of the 8000 involved in the strike.

**Pattern Summary** — Industry-wide bargaining is common in Europe, but it's difficult to achieve here. Better bargaining is the best approach to the pattern problem, supplemented under special circumstances by a joint company stand or by the threat to move the plant.

Pattern bargaining is a big reason why wages have risen so rapidly since the end of World War II, to outpace the rise in productivity. Comments one of the pattern's victims: "If we don't break the pattern, many of us will be priced out of business."

## Large Spider Assembly Requires Precision

A special 108-in. shaft spider assembly for a marine armature is machined at Hahn Mfg. Co., Cleveland. It is made from six spider plates welded radially to a central shaft. Machining operations, including both the shaft step turning and interrupted cuts on the welded spiders, are performed with carbide tooling on a 48-in. Monarch lathe

*\* An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Panton Bldg., Cleveland 13, Ohio.*

Because more than 500 representatives from 40 foreign countries attended the World Metallurgical Congress in Chicago last week, this "Welcome to America" luncheon was appropriate. Left to right are: Dr. Jacques Pomey, president, Societe Francaise de Metallurgie, Paris; G. M. Young, president-elect (1957-58), American Society for Metals, and technical director, Aluminum Co. of Canada Ltd., Montreal; I. W. Wilson, chairman, Aluminum Co. of America, Pittsburgh; and Dr. Donald S. Clark, president, ASM (1956-57). Standing is Charles M. White, chairman, Republic Steel Corp., Cleveland

# Metal Show Attracts World

THE WORLD looks to the U. S. as the leader in down-to-earth practices in metalworking, despite Russian achievement with out-of-this-world sputniks.

More than 500 representatives of 40 foreign countries visited and participated in the National Metal Congress, National Metal Exposition, and Second World Metallurgical Congress in Chicago last week. Machinery and equipment made in several foreign countries was demonstrated, with the hope a market would be found for it in the big U. S. metalworking industry.

**India Looks On**—Prominent in numbers were representatives of India, where the steel industry is being expanded with several new plants and by the enlargement of its one present plant.

**Emphasized** — Despite the vastness of the show (around 500 exhibitors), it was easy to see that emphasis was on vacuum melting equipment, testing equipment for automatic lines (including ultrasonic testing and cleaning), and chemical milling.

A laboratory vacuum melting furnace on exhibit performed seven

functions: Resistance melting, induction melting, annealing, degassing, heat treating, brazing, and sintering. It melted up to 12 lb of steel. Several models of its production counterparts were also shown. Trends in increased output, temperatures, and vacuum were noted.

**Hitching to Automation**—Exhibitors of cleaning and degreasing equipment emphasized the adaptability of their equipment to automatic lines.

Another recognition of the move toward automaticity was a demountable transfer device which automates straight side presses. The device enables one press to do the work of several. In one installation, the exhibitor reported, it made it possible for one press to do the work of six.

**Looking for Markets**—Chemical milling companies were stressing the versatility of their process and its mass production capabilities. Adopted three years ago in the aircraft industry, the process removes metal by chemical rather than mechanical means. Its basic tools are a tank, a mask to cover surfaces that are not to be worked, and a chemical solution to dissolve the metal.

Two claims were made by an exhibitor of an oscillating carbide tool grinder that embodied an electrolytic method: Elimination of effort and fatigue of manual tool oscillation and an 80 to 90 per cent reduction of diamond wheel consumption.

**No Hands!**—A small, fully automatic diecasting machine that requires no operator was introduced. It produces zinc alloy castings weighing up to 1 lb at production rates often exceeding 1500 shots per hour. Operations include machine cycling, die cleaning and lubricating, inspection for foreign matter in the die, water control, replenishing molten metal, and picking off the castings.

**Labor Saver**—Pushbutton painting was demonstrated. The all-electric system uses the electrostatic principle. Exhibitors point out that only one operator is used.

Another company showed a high speed, low cost, hard facing process that does not use compressed air. Utilized are oxygen and acetylene or hydrogen gas.

# Electronic Counters Gain

High speed instruments are no longer limited to recording production count. New functions include traffic control, inspection, data processing, and missile guidance

"THE BAKER'S DOZEN is a thing of the past now that predetermined counters are on the job at leading bakeries throughout the nation," says Potter Instrument Co. Inc., Plainview, N. Y.

There's no denying that counting devices are becoming increasingly useful. "They're being designed as parts of control, inspection, and data conversion systems, rather than as tools for recording production count," Potter explains.

Sales of counting equipment will approach \$150 million this year, up 5 per cent from the 1956 level. Continued growth is expected in 1958. While the manufacture of counters requires relatively little steel, it involves large quantities of diecastings and stampings.

If electronics is the key to better production control, as one instrument maker suggests, it's also a major factor in the development of new uses for counters. Says a spokesman for Post Machinery Co.,

Beverly, Mass.: "Adaptation of electronics in design and operation broadens the scope of conventional counters, permitting higher speeds for unit counts and lineal footage."

**Makers**—Twenty-seven companies make electronic counters, and most of them were established within the last five years. Forty make counter-control devices—hand, mechanical, magnetic electrical, electronic, and pneumatic.

Counter-controls, many with computer components, give accurate data on number of pieces produced or handled, fluid flow volume, and length measurements. They use time, cam sequence, pulse frequency, revolutions, and stroke as basic operating factors. Any object that can break or change the intensity of a light beam is within electronic counting range.

**Users**—In steel mills and fabricating plants, electronic counters measure and cut to length wire, bar stock, strapping, and tubing.

They shear strip material in this fashion: A friction wheel rides on the moving strip. With each revolution, an electromagnetic pickup generates a voltage pulse. When the counter receives the number of pulses corresponding to the desired strip length, it operates the shear. Another counter takes over, stacking the strips in exact quantities (see photo caption).

The textile industry is the leading user of lineal devices. A single knitting machine often has four counters. Other users: Manufacturers of paper, rope, sheet products, and coiling equipment.

**Packaging**—Electronic counters are especially useful in packaging operations. They place exact quantities of pills, capsules, and other small objects in bottles or boxes. Unit counting is replacing weight as the packaging standard. There's a trend toward designing special counters for original equipment.

"Precision electronic instruments can perform a variety of tasks, including counting, inspection, quality control, traffic control, and operator protection," says Edward J. Zeitlin, president, Standard Instrument Corp., New York. His firm produces photoelectric controls, time recorders, print-out counters, and predetermined electronic counters. Designed for maximum flexibility, the instruments regulate the manufacture of products as dissimilar as airplanes and zwieback.

Photoelectric control devices are usually integrated with tolerance, inspection, and safety factors. They're so sensitive that they reflect any change in light intensity as well as a break in the beam. When work or tools are out of alignment, the machine stops automatically.

**Automation**—The largest manufacturer of counting instruments, Veeder-Root Inc., Hartford, Conn., has introduced a series of counters for use in the rapidly growing fields of automation, control instrumentation, and electronic accounting. The instruments perform all functions of conventional counters and create an electrical circuit for remote reading or recording of data on printed forms. Veeder-Root began production at a new 110,000 sq-ft plant in Altona, Pa., early this year.

Potter Instrument Co. Inc. and U. S. Steel Corp.

Predetermined electronic counter (black box, center) controls stacking of sheets. As sheets move down conveyor, they interrupt a photoelectric beam, feeding counts into counter. When required number of sheets has been stacked on one pile, deflector operates, feeding next batch into another pile

# Presidents Made More in 1956

(Average compensation of chief executive officer)

Company Profit Ranges	Average: 18 Industries		Light Machinery		Heavy Machinery	
	1955	1956	1955	1956	1955	1956
\$ 3 million	\$ 71,500	\$ 76,000	\$ 80,000	\$ 86,000	\$ 76,000	\$ 82,000
\$10 million	\$102,600	\$108,000	\$123,000	\$115,000	\$107,000	\$105,000
\$40 million	\$155,700	\$164,000	\$195,000	\$160,000	\$152,000	\$200,000

## LIGHT MACHINERY:

Office equipment, components, home heating & plumbing equipment, home appliances, pneumatic tools, small electronic equipment, brass mill products, small fabricated items.

## HEAVY MACHINERY:

Locomotives, other railroad equipment, hydraulic presses, machine tools, farm & construction machinery, large electrical equipment, printing equipment, industrial furnaces, oil well drilling equipment, pumps, compressors, elevators.

Source: McKinsey & Co. Inc.

## Executive Earnings Rise

The trend is up in both salaries and fringe benefits. Light and heavy machinery officials make more than their counterparts in other metalworking industries

MOST metalworking executives got salary boosts in 1956. This is shown in a survey of 641 firms in 18 industries. (It was done by McKinsey & Co. Inc., New York management consultant firm.)

Chief executives in the light and heavy machinery industries head the list. (See table above.)

In general, the more money a company makes, the more it pays its executives. In some instances, the chief executive of a smaller firm was paid more than his opposite number in a larger company. Example: Most heads of light machinery companies received more money than those in heavy machinery, even though the heavy machinery category had larger sales, profits, and assets.

**Dollars**—Average compensation for the chief of a light machinery company was \$97,000 in 1956 (64 firms reporting). It was a 4.2 per cent increase over the 1955 figure. The president of a typical heavy machinery firm didn't do quite so well: His 1956 pay check came to

\$92,000 (52 firms reporting), but it was 4.8 per cent better than he did in 1955. Both figures were above the average of the 16 other categories covered. A few industries, such as steel, were considerably higher.

In the few cases where lower salaries were reported, it was generally because a new man had filled the chief executive slot and was making less than his predecessor.

Compensation of lesser executives in light and heavy machinery also increased. Both industries paid their No. 2, 3, and 4 men about on a par with industry as a whole. Light machinery people earned a little more than their counterparts in heavy machinery. Proof: The average No. 2 man in light machinery made \$67,800, the No. 3 man \$56,500, and the No. 4 man \$54,600. In comparable jobs, heavy machinery people received \$66,000, \$55,200, and \$50,100.

**Extras**—Besides salary, most executives received supplemental benefits. Deferred contingent com-

pensation was reported by 26 per cent of the executives in light machinery and 17 per cent in heavy machinery; 59 per cent in light machinery got stock options, versus 55 per cent in heavy machinery; 88 per cent in light industry had pension plans, versus 94 per cent in heavy machinery. The trend toward even greater supplemental benefits will continue, believes Frank Thompson, McKinsey consultant.

**Good Business**—Sales of light and heavy machinery showed a sharp gain over 1955 performance. The average light machinery firm took in \$126.8 million, a 17.6 per cent increase. The average heavy machinery firm had sales of \$143 million, a 16.1 per cent gain.

Profits were up, too. Light and heavy machinery ranked first and third in the average percentage increase in industry net profits. Average net earnings of light machinery companies jumped 18.9 per cent to the \$7.4 million mark. Heavy machinery companies registered a 16.3 per cent gain and had average profits of \$7.8 million.

Total assets in both industries rose, but not as much as the profit jump might indicate. The typical light machinery firm increased its assets to \$87.6 million in 1956, a 9.6 per cent gain in a year. Heavy machinery companies reported average assets of \$121.3 million, an 8.1 per cent rise.

*George M. Humphrey sees more expansion ahead as . . .*

## National's Capacity Grows

"YOU ain't seen nuthin' yet."

George M. Humphrey uses those everyday words to bring home a big concept: The future of the steel and metalworking industries.

Admitting that recent expansion programs have pushed capacities above immediate consumption demands, the former secretary of treasury who returned to industry as chairman of National Steel Corp., Pittsburgh, predicts new expansion programs will be necessary within a few years.

"We never have stood still in this industry. I don't think we ever will."

**For 1958**—In his first public in-

terview since leaving the President's cabinet to take the National Steel post, Mr. Humphrey predicted steel output in 1958 will be no less than it was in 1957. Ingot output will be in the 115 million to 117 million ton range, giving us one of the best years on record.

Thomas E. Millsop, National Steel president, pointed out that production in tons will be comparable to that of recent records, but steelwork operations expressed as a percentage of capacity will be lower. Mr. Millsop said the industry started 1957 with a capacity of 133.5 million tons. At present, it is about 138 million tons.

Sometime in 1958, it will reach 143 million tons as facilities now being built are brought into production.

On the new capacity basis, Mr. Millsop says, 80 per cent operations will produce as much steel as 100 per cent operations did a few years ago.

**More Efficient Capacity** — Mr. Humphrey acknowledged that capital expenditures for industrial expansion are letting down. He expects the trend to continue into 1958. He emphasizes that the need for keeping present capacity modern and efficient will be a big support for the economy. Capital goods makers will find a fairly strong market for their products in keeping the industrial machine up to date.

National Steel is rounding out an expansion program that represents an outlay of half a billion dollars from 1952 through 1957. The program will increase National's ingot capacity by a million tons. When it is completed, National's steelmaking divisions, Great Lakes Steel Corp. and Weirton Steel Co., will be able to produce more than 7 million tons of ingots annually.

**Consolidating Gains**—Mr. Humphrey says National Steel has no immediate or definite plans for further expansion programs. The corporation's next step will be to get its new and revamped facilities into high gear. A study of national needs and markets will continue.

National does not have any plans to enter into the production of new types of steel products. Most of the corporation's facilities are designed for the production of light flat-rolled steel.

National Steel has two sites that could be used for new plants in the future. One includes 2150 acres in the Delaware River Valley near Philadelphia and the other 750 acres at Chicago. Mr. Humphrey gave no indication that definite plans for building at either are being considered.

**Double Iron Capacity**—The expansion program at Great Lakes has doubled coke and iron production at Zug Island. The 148 coke ovens added have the capacity to carburize 3800 tons of coal a day.

The program includes the construction of one new blast furnace and the complete rebuilding of another. The rebuilt furnace has a hearth diameter of 30 ft 3 in. and is 110 ft high.

Under construction and scheduled for completion next spring is a new 7200-ton per day sintering plant.

**Giant Furnaces**—National has taken the lead in building big open hearths. Great Lakes has 14 furnaces of 500-ton capacity and three smaller units. Weirton has some 600-ton units.

To obtain maximum efficiency in its large open hearths, the company incorporates the bessemer converter with the open hearth process. Blown metal is charged into the big furnaces, materially increasing production.

**Next Price Increase** — When asked whether steelmakers will increase prices next July when an automatic wage hike becomes effective under the industry three-year contract with the United Steelworkers, Mr. Humphrey opined that at least some of the increased costs would have to be passed along to the steel buyers.

"Over a period of time we can count on increases in productivity to afford increases in wages. But when they happen too fast, there is no alternative to increasing prices."

Mr. Humphrey stuck to this opinion last week when he refused to agree with Senator Kefauver (D., Tenn.) that National should cut prices now to combat inflation.

He told the Senate subcommittee, investigating the \$6-a-ton steel boost last July, that he had not changed his beliefs. Inflation must be checked, he said, but his company is "not prepared to make any changes whatever in its prices at this time."

National was forced to increase prices to retain its competitive earning position in the industry, Mr. Humphrey told the senators, adding that he could think of no reason why his company should not do its best to make more money than its competitors.

He said the steel boost meant about \$1 to a family that uses 1000 cans of food a year, and \$8 to \$10 more for a car that costs \$2000 to \$4000.

## Bethlehem's Grace Retires

At 81, "grand old man" of steel industry turns over reins of nation's second largest steelmaker to A. B. Homer. Now honorary chairman, Mr. Grace will continue as director

**COLORFUL** and energetic, but ailing, Eugene G. Grace, for 12 years chairman of Bethlehem Steel Corp., retired on Oct. 31. A. B. Homer, who served as president throughout Mr. Grace's term as chairman, was made chief executive officer in time to report a record nine-month net income of \$143,752,627.

**Engineer**—Born Aug. 27, 1876, in Goshen, N. J., Mr. Grace received a degree in electrical engineering from Lehigh University in 1899. He immediately went to work for Bethlehem, where he was put in charge of an electric crane. He became superintendent of yards and transportation in 1902. In 1906, he went to Cuba to reorganize the firm's ore properties.

**Executive** — He was appointed general manager of Bethlehem

Steel Co. in 1908 and became its president in 1913. Three years later, he became president of Bethlehem Steel Corp. He served as chairman since Dec. 20, 1945.

**Leader**—Mr. Grace was president of AISI in 1935-36 and is still a director. His many honors include the AISI Gary Medal in 1934, the Bessemer Medal from the Iron & Steel Institute of Great Britain in 1942, and the Rand Medal from the American Institute of Mining & Metallurgical Engineers in 1948.

**His Successor**—Mr. Homer, 61, started with Bethlehem in its Quincy, Mass., shipyard in 1919. He is a vice president and a director on the executive committee of AISI. During his presidency, Bethlehem's annual rated capacity has grown from 12.9 million to 20.5 million tons.

## New War Plans Coming from JCS

SOURCES around the Commerce Department and the Office of Defense Mobilization say the joint chiefs of staff will hand down new war plans around the first of the year. The information is not received with as much enthusiasm as you might expect. In the past, the joint chiefs have failed to give defense mobilizers a really solid idea of what they want on the basis of what war they expect. However, with Sputniks I and II whizzing over our heads, the folks who do the war preparation paper job have high hopes of getting some concrete requirements to work with.

Many of these men who must deal directly with industry on war mobilization have been as much in the dark about our planning as the man in the street.

What is needed, they indicate, are specific directions from the joint chiefs on how it expects to fight:

1. An all-out nuclear attack.
2. A limited war with small nuclear arms.
3. A general war with small nuclear arms.
4. Another Korea (no nuclear weapons).

If the joint chiefs will state general policies on how to approach the situations, ODM and Commerce can do their jobs.

## What Stockpiling Committee Means

The interest in war plans is sharpened with the work ODM's stockpile advisory committee is doing (STEEL, Nov. 4, p. 192). Headed by Holman Pettibone, Chicago banker, the committee includes many men well versed in the problems of World War II and Korea and scientists who may be expected to understand the latest developments in nuclear weapons and missile materials. It has already established a working relationship with the National Science Foundation's Materials Committee. A spokesman indicates the ODM committee is a co-operative effort designed to give Defense Mobilizer Gordon Gray the latest thinking on stockpiling problems.

Six federal departments (maybe more later) form a backstopping advisory group for the committee. The six are: Defense, State, Commerce, Interior, Agriculture, and the Federal Civil Defense Administration. Working behind closed doors for the last several weeks, the committee's staff has established liaison with these departments and interested committees on Capitol Hill.

## Full Review: Some New Concepts

The committee is conducting a full review of our stockpiling program and presumably relating that to our whole mobilization effort. The committee ranks its problems: First, additions to the stockpile; second, retention or disposal of materials already stocked. The whole committee will meet at least three times by year's end. A small staff is doing the digging job in Washington. A report to Mr. Gray is due "as soon as possible" after Jan. 1.

Some new concepts have come out of this committee, perhaps recommendations for legislation, too. In the past, we have simply stocked critical materials for one type of war of a given length. Several industry advisory groups, and companies, have been critical of our mobilization efforts.

Says one source close to the committee: "We know the direction we want to go; a reorientation of our thinking may be necessary."

Of most immediate concern to metalworking are the buying programs for nonferrous metals and Uncle Sam's huge supply of machine tools. Chances are that the committee and ODM will continue to approach both problems with extreme caution. In today's economic climate, there will be no wholesale dumping of materials or machines. But there may be much slower buying programs.

Of more interest to metalworking will be the committee's recommendations to buy some of the newer glamour metals and advice on how to produce them in greater quantities.

## 'Bold New Approach'

In the same context, last week Sen. Lyndon Johnson (D., Tex.) called for "a bold, new approach" to our thinking on defense problems. He made the appeal at the Pentagon just before joining Sen. Richard Russell (D., Ga.) and Sen. Styles Bridges (R., N. H.) for a special briefing by top defense officials. The three senators will lead the armed services committee in the investigation of our missile program. Senator Johnson reports his preparedness investigating subcommittee has completed preliminary research. Formal hearings will begin this month.

Top level meetings of the National Security Council at the White House are in the same area. The administration is desperately trying to work out a new defense look, yet keep it in line with a fiscal 1959 budget of less than \$73 billion.

## Investigations Will Be Messy

Several congressmen are warning that the investigation will be the "messiest" in years, with Democrats and Republicans alike demanding to know exactly where the U. S. stands as a world power in missiles and atomics.

Heads will roll at the Pentagon if some willing witnesses are allowed to testify. In addition, U. S. industry will be in for some criticism.

*Such machines will be at work next year, turning out . . .*

# Manmade Diamonds from GE

GENERAL Electric Co.'s Metallurgical Products Dept., Detroit, plans large scale production of industrial diamonds next year.

Eventually, GE hopes to supply at least half the industrial requirements of the U. S. The manmade stones have all the qualities of their natural counterparts.

**Fast Start**—About 100,000 carats have been made in pilot plant production since the company first announced (February, 1955) it had learned how to make diamonds, says Kenneth R. Beardslee, GE general manager.

The stones range from 60 to 600 grit (the equivalent of fine to coarse grains of sand). Mr. Beardslee says the diamonds cost \$4.25 per carat, compared with \$2.85 for imported natural bort (grit). This year, 7 million carats in the 60 to 600 grit range will be imported from Belgian Congo and South Africa.

**Insures Supply**—The number of carats we import is allocated by a diamond syndicate, which controls shipments throughout the world. (An extra U. S. allocation is stockpiled for defense needs.)

In interpreting the importance of this domestic source, Mr. Beardslee points out that the size range of GE's product meets more than two-thirds of the nation's industrial requirements. Some major uses: Machining operations, grinding, lapping, and cutting tools.

**Uses Growing**—Charles J. Koebel, president, Koebel Diamond Tool Co., Detroit, recently told the American Society of Tool Engineers that low cost diamonds weighing about 1/50 of a carat will do jobs which once called for stones as large as 20 carats.

The Koebel firm and Jones & Lamson Machine Co., Springfield, Vt., have developed processes and tooling which can use small diamonds (like GE makes) in cutting tools.

In an experimental run, a diamond cutter was used to dress a series of grinding wheels. After handling 167 miles of surface on 15 resinoid wheels (over 124 hours of machining), wear on the cutter was only 0.0003 in., says Mr. Koebel. Jones & Lamson is offering nonexclusive, nonrestrictive licenses for the use of the cutters and processes.

**Potential Uses**—John D. Kennedy, manager of GE's diamond section, suggests other uses.

**Example:** Ford Motor Co.'s glass plant uses 28 to 32 grinding stations. Carbide wheels (12 in. in diameter) are used to polish large sheets of plate glass.

Extrahard industrial diamonds should increase the life of the wheels and possibly reduce the number of grinding stations to eight. Mr. Kennedy thinks the glass industry could use 3 to 6 million carats a year.

Concrete sawing and lensmaking are other possibilities.

**The Future**—GE is acquiring the technological knowhow needed to make larger stones—perhaps large enough to replace natural diamonds in oil well drill bits.

In connection with its research, the company is investigating pressures between 2.5 million and 6.25 million psi and temperatures over 5000° F. Says Mr. Kennedy: "This superpressure - temperature work has given us a new research tool . . . to test hardness, strength, ductility, and conductivity of many materials."

## Pretesting New Products with Customers Will Answer These Questions...

1. What design changes are necessary for customer acceptance?
2. Can these changes be done with your production facilities?
3. Will the changes result in an objectionable price increase?
4. Where different test customers request different modifications, should additional models be added to the line to satisfy such demands?
5. Should installation be done by the factory or the customer? Will design changes be required in either decision?

## Pretesting Ups Your Odds

You can do a lot of it in the lab, but the potential customer holds the key: He'll not only tell you what's good about your product but also what he thinks it lacks

AFTER WORLD WAR II, Minnesota Mining & Mfg. Co. developed a nonfading, maroon automobile paint. It was a good product, but sales never caught on, so 3M dropped it. Auto buyers were still distrustful of maroon because of prewar experiences.

Fortunately, most manufacturers of industrial products don't have to contend with the intangibles facing consumer goods makers in pretesting new products. But that doesn't mean that pretesting isn't important to them: It can determine the success or failure of your new product and whether you spend the minimum or maximum for tooling and tooling changes.

**The Aims**—Pretesting has these objectives: 1. Determining whether a new product meets its quality and performance requirements. 2. Trying to insure initial customer acceptance.

Basic information on the first objective is generally obtained in the laboratory. The second objective,

according to many new product managers, is the most important and can best be done in the field with the help of potential customers.

Here's what you can learn:

**1. Is Design Satisfactory?**—Stewart-Warner Corp. is pretesting a centralized lubricating system which can be used in practically all types of machinery. Users who tried it have come up with ideas like this: Use a plastic oil reservoir so the oil level can be seen readily, eliminating the need to check a gage.

DoAll Co. checked with customers for suggestions on its new high speed cutoff saw and got this: Why not replace the steel blade guide inserts with carbide guides? Carbide guide inserts are now standard equipment on the saws. Comments L. R. Rothenberger, vice president: 75 per cent of the improvements on this saw have come from customer suggestions.

**2. Are Price, Cost Right?**—

Pretests by customers will reveal these frequently overlooked costs: Installation and servicing. Who should install your product and service it? Will these costs added to the product's price make total cost too high?

Minneapolis-Honeywell Regulator Co. is developing a lighting system which controls room illumination according to the amount of daylight coming through windows. It's designed to save electricity in schools and other buildings. The major problem in costs is to keep installation expenses to a minimum. **Solution:** Honeywell is working with contractors and architects to get the system installed during construction rather than after, when costs would be higher.

**3. What About Local Conditions?**—Pretesting can reveal overlooked factors like variations in climatic conditions and customer shop or operating practices. In pretesting industrial tapes, 3M has learned they must withstand a wide range of temperatures. In some plants, temperatures never vary out of the 60 to 90 degree range; smaller shop owners often shut off heat from Friday afternoon until Monday morning to save fuel costs; temperatures may go below 32° F.

**Advice**—One precaution most executives recommend is to make sure you've made all necessary patent

filings to protect your development. Your test customer isn't going to take your development, but he has plant visitors who might be interested.

Another bit of advice: Try to maintain good control of pretesting to insure desired results.

Some companies rely on salesmen to provide the liaison between the test customer and new product engineers. Others prefer to have the engineers work directly with test customers. Test results are written up and analyzed by representatives from production, engineering, sales, and marketing to iron out compromises on five questions (see checklist on Page 70).

**Expect Surprises** — Pretesting will sometimes result in unusual situations such as DoAll experienced with its cutoff saw. The saw was originally designed to compete in the bandsaw classification. Officials knew the price would be slightly higher than that of existing saws but felt customers would gladly pay the premium for superior performance.

The assumption proved correct, but, as pretesting and customer feedback on initial sales continued, product modifications upgraded the saw into the power hacksaw category—both in price and performance. Officials recognized this and decided to design a new saw of the same type but with a lower price to compete with the bandsaw equipment which was the original goal. They did it by decreasing the saw capacity and stripping off some of the gingerbread. Recently, they added a third saw to the line—a larger one which competes with cold cutoff saws.

**Test Period**—How long should you pretest a product? It depends upon the new product and how much tooling will cost if later changes are required. Experience indicates that over half of all new industrial products will take two to five years to pretest.

There's no established formula. It's like making love, claims an eastern new product manager. Experience is your best guide, but each new situation demands an individual approach.

## Semiconductor Boom Kicks Sales Estimates Up\*

	Revised Estimate	Estimated Last Fall
1961	\$450 million	\$400 million
1960	\$350 million	\$300 million
1958	\$200 million	\$150 million
1957	\$125 million	\$100 million

\*Source: Joseph S. O'Flaherty, manager, Semiconductor Div., Hughes Aircraft Co.

Hughes Aircraft Co.

*This assembly line moves fast as . . .*

## Semiconductor Sales Soar

IN CONTRAST to plateaus and slackening trends in many industries today, semiconductor makers have upped their estimated dollar volume for 1957 by 25 per cent (see table). Sales in 1956 hit \$70 million.

The youthful industry (it hardly existed five years ago) has only started to grow, claims Joseph S. O'Flaherty, manager of Hughes Aircraft Co.'s semiconductor division, Los Angeles.

**Drop in Price**—A germanium diode used in computers, which sold for \$5 four years ago, now costs 70 cents. A silicon power rectifier which cost \$7 about 18 months ago now sells for \$3 and a silicon diode used in instrumentation, tele-

metering, and data processing has dropped from \$6 to \$1.25 in two years.

**Jump in Production**—While dollar volume for 1957 will be about 70 per cent above last year's, unit sales will more than double.

Hughes is increasing its manufacturing space from 135,000 to 205,000 sq ft. About 40 U. S. companies now make the product.

**Things To Come**—Mr. O'Flaherty said the semiconductor would make it possible to recharge automobile batteries overnight simply by plugging into an electric outlet, to stop the cycle-change noise in washing machines, and to upgrade the efficiency of home appliances and power tools.

MODERN INDUSTRY

# Horsepower Race Ends?

Automakers play down increases in horsepower ratings (see table), but dealers still have a loophole: They have plenty to offer the speed merchants

THE HORSEPOWER RACE is over—or is it? Automakers seem to be playing down obvious increases in horsepower ratings.

Skeptics will be disappointed. The industry is abiding by the advertised horsepower ban established by its own Automobile Manufacturers Association.

**Explanation**—Rated horsepower is higher because 1958 engines were designed and tooled long before Detroit felt the full impact of politicians' cries for less speed and more safety.

Since the multimillion dollar programs couldn't be altered, the industry has canceled out the horsepower boost by changing axle ratios. The tactic resulted in some economy gains, with little sacrifice in performance. And economy is what many 1958 buyers want.

**Buick**—The Special series has not increased horsepower (250 at 4400 rpm), but it has lowered the axle ratio from 3.07:1 to 3.23:1 for cars with automatic transmissions. Theoretically, Buick should get slightly faster acceleration but poorer gas economy in starting ranges and lower top speed.

But Buick has made some changes in the pitch of its Dynaflo transmission which will give better gas economy in starting ranges without cutting down on quick pickup.

**Oldsmobile**—This GM division has boosted horsepower from 277 to 305, but the axle ratio with standard automatic transmission is unchanged (3.23:1).

Oldsmobile's Super 88 should accelerate faster, but gas economy in the starting ranges will be down. Top speed also should be up, as will cruising speed gas consumption.

**Plymouth**—The standard engine in Chrysler Corp.'s low-priced ser-

ies has boosted horsepower and axle ratios (from 3.36:1 to 3.31:1).

On Belvedere models equipped with automatic shifts, acceleration could be slower (theoretically). Actually, increased horsepower and higher axle ratios tend to cancel out each other, so cars with this setup will perform about as well as 1957 jobs.

**Ratings**—Advertised horsepower is obtained by running a stripped-down engine on a dynamometer test stand and taking the average maximum reading from at least five trials. There are no generators, fans, or air conditioners to rob the engine of its full horsepower potential.

Net horsepower is figured with the engine installed in a car with all accessories operating.

Rear wheel horsepower is the horsepower delivered to the rear wheels. It's what is left after losses in the power train (transmission and differential) are deducted from net horsepower.

**Dealer's Choice** — Advertised horsepower is the figure dealers like to use since it's considerably higher than the others. Sometimes even this rating is played down.

Mercury's Park Lane and Lincoln share the same 430 cu in. engine with identical compression ratios. Lincoln reports the engine turns out 375 hp at 4800 rpm. Mercury claims 360 hp at 4600 rpm.

**Here's How** — Both statements are true, but Mercury has taken its readings on a lower range, so the Park Lane won't appear to be as powerful as the Lincoln.

Although the horsepower race has halted for now, dealers are in the position of having their cake and eating it, too. Once a prospect is in the salesroom, they can point to greater gas savings

1958	HORSEPOWER	1957
310	Cadillac	300
375	Lincoln	300

through easier working engines and, for the speed jockey, they can point to higher horsepower.

## Packard To Use Plastic

Packard's 1958 models will be built with laminated plastic hoods and snouts.

Eugene J. Hardig, chief engineer,

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

## Cadillac's Sedan de Ville

### ENGINE

Type: OHV V-8	Carburetor: Four barrels
Displacement: 365 cu in.	Torque: 405/3100 rpm
Compression ratio: 10.25:1	Horsepower: 310/4800 rpm

### DIMENSIONS

Wheelbase: 129.5 in.	Width: 80 in.
Length: 225.3 in.	Clearance: 6.4 in.
Height: 59.1 in.	Axle ratio: 3.07:1

Studebaker-Packard Corp., says the switch was made because of lower tooling costs although piece price is higher than that of steel counterparts.

"The cost of plastic tooling for the two parts was only \$65,325. Steel tooling costs would have been about \$500,000," he explains.

Mr. Hardig says plastic is economical for other parts only if they're complex. Otherwise, it's cheaper to use steel.

## Ford Reports Earnings

Ford Motor Co. reports nine-month dollar sales are \$4.4 billion, compared with \$3.2 billion in the same 1956 period.

Earnings were \$229.5 million, up 58 per cent from the \$145.2 million earned in the first three quarters last year.

Henry Ford II, president, says before-tax profits were almost 28 per cent below the \$312.2 million earned in 1955. He explains this is because the company has spent more than \$115 million on expansion and bringing out new product lines. Last year, similar capital expenditures totaled \$60 million.

Mr. Ford adds the company has sold 1,742,208 cars and trucks in

the first three quarters, compared with 1,380,063 vehicles for the like 1956 period.

## Chrysler Supplier Stays

Electric Auto-Lite Co., Toledo, Ohio, will continue to supply starting motors, distributors, generators, and voltage regulators for Chrysler Corp. cars.

J. P. Falvey, Electric Auto-Lite president, says his firm has signed a three-year contract with the automaker. The company also says it's co-operating with Chrysler on long range development of other electrical components.

Initially, Chrysler indicated it was going to engineer and make the four items itself. The company has not made clear whether it will continue to buy other electrical parts from present vendors.

## Exhaust Notes

- Major truck builders are increasing prices about 5 per cent on heavy and medium-heavy lines. GMC Truck & Coach says its price boosts will average about 3 per cent although the average raise on pickup trucks is about 2.3 per cent.
- GM says it can cut down 90 per

cent on oxides of nitrogen in automotive exhausts, but the special carburetor used for the job also cuts gas economy to about 11.8 mpg, compared with 15.9 on a control car with a standard carburetor.

- From Jan. 1 through Oct. 20, American Motors Corp. reports dealers sold 72,856 Ramblers, compared with 71,330 in calendar 1956. Sales in 1955 came to 73,807 units.

- Volkswagen has increased its port-of-entry prices on sun roof and sedan models by \$50. This puts the port-of-entry Detroit price at \$1718.59 for the VW sedan. Company spokesmen say 98 per cent of the VWs entering this country are equipped with whitewall tires which adds \$25.75 to the port-of-entry price.

- James J. Nance, vice president and general manager of Ford's Lincoln-Mercury Div., says the marketing job done by industry next year could be the deciding force in determining the level of the national economy. "If there's enough change in the 1958 models, the auto industry could have a substantial part in making it a good year," he adds.

- Suppliers to the motor vehicle industry produce between \$5 billion and \$6 billion worth of automotive products annually, reports the Automobile Manufacturers Association.

# **FACTS**

## **NEW DEPARTURE PILLOW BLOCKS— BUILT FOR LOWEST MAINTENANCE**

- New Departure adapter ball bearings are sealed and lubricated for life.
- Design is compact and rigid—fits easily in limited space.
- No grease nipples or other protruding lubricating fixtures needed.
- Pillow blocks are easily mounted without need for any special tools.
- New Departure ball bearings are high capacity, precision-built for long life.
- Bearing and block surfaces are spherical to accommodate any misalignment.
- Thirty-two shaft sizes,  $\frac{1}{2}$ " through  $2\frac{15}{16}$ ", for wide variety of applications.
- Interchangeable with most other makes of pillow blocks.

Mounting pads are furnished with each New Departure Pillow Block to assure easy interchangeability with all pillow blocks having a high base-to-center dimension.

Bearings are easily applied to shafting and are positively locked in position with eccentric cam locking collar and set screw.

Elongated bolt holes designed to accommodate practically every type of spacing for hold-down bolts.

EQUIPPED WITH

New Departure Pillow Blocks employ performance-proved Type AE adapter ball bearing with Senti-Seals for long-life protection against dirt or grease leakage.

*How to save on critical alloys and still get high alloy turbine performance*

## USE "17-22-A" STEELS

**Contain less than 3% alloy... give maximum strength to 1000° and 1100°F**

**Y**OU don't have to use an expensive high alloy steel for gas turbine or other parts that operate up to 1000° and 1100° F. You can use "17-22-A" steels made by the Timken Company—*low* alloy steels—to do the same jobs. They give *high* alloy performance, save critical alloys, cut costs. They contain less than 3% alloy, yet they give maximum strength up to 1000° and 1100° F.

You get more advantages. "17-22-A" steels resist heat checking and thermal cracking. They are readily workable up to 2300° F. They are easily machined and

welded. And maximum high temperature properties can be developed by normalizing and tempering, minimizing the possibility of distortion and quench cracking.

Send for complete information on "17-22-A" (S) steel, and its companion analysis, "17-22-A" (V), recommended for temperatures up to 1100° F. Ask for Technical Bulletin 36A. And call upon our technical staff for help with your high temperature steel problems. The Timken Roller Bearing Company, Steel and Tube Division, Canton 6, Ohio. Cable: "TIMROSCO".

See the next Timken Televent hour, "The Innocent Years" over NBC-TV, Thursday night, November 21st.

## Metalworking's Share of GNP May Dip

IN 1958, the nation's economy will move sidewise much as it has in 1957, but key barometers indicate metalworking's share of the gross national product will decline.

The prediction was made by Martin R. Gainsbrugh, chief economist of the National Industrial Conference Board, at the Convention of the National Tool & Die Manufacturers Association.

**Prime Factors** — The rate of growth in gross national product in 1957 is about equal to that of 1956. Department of Commerce statistics showed GNP in the third quarter of this year equal to an annual rate of \$439 billion. The fourth quarter will be even better, said Mr. Gainsbrugh. Here are the major factors in his business outlook and their importance to metalworking's outlook:

1. Consumer spending remains high, and indicators point to a continuation at that level. The key to this barometer, however, is where the money is going. Manufacturing of hard goods is sagging, but nondurable goods, such as tobacco, food, and paper hit a record high in September. The consumer is reorienting his budget toward more of such goods.

Commenting on declines in manufacturing employment, the economist pointed out that total non-farm employment in September

was at a record high. The bulge was created by employment in activities such as insurance, finance, wholesaling and retailing, construction, state and local governments.

2. Private investment figures offer the darkest view for metalworking. During the first nine

months of 1957, personal consumer expenditures increased 5.3 per cent over the comparable year-ago figure; government purchases increased 9.5 per cent; but gross private investment declined by 1.1 per cent, with all sections participating in the downtrend.

**Cause for Concern**—The most

U. S. Bureau of the Census. Data based on reports from commercial and capital forge shops with monthly shipments of 50 tons or more.

significant decrease was in investments for producers' durable equipment. During 1956, this segment showed an increase of 18.6 per cent over 1955. For three quarters of this year, it has declined steadily, standing only 5.2 per cent above the 1956 pace during the third quarter. Mr. Gainsbrugh feels the advantage will shrink to nothing in the current quarter and show minus signs next year. Reason: Capital expenditures, which have been a major prop to the economy, are now completed or are being scaled down. Production capacity from now until the 1960s will continue ahead of demand and reduce pressure for more expansion.

3. Federal expenditures are to be slashed, and if these cuts go through, they'll be reflected in lower metalworking sales. One possible offset to this decline is increasing spending by state and local governments. Pressures here will continue as school, highway, hospital, and other institutional programs are initiated to meet problems created by our population increase and the shift to the suburbs.

Three Big Ifs—The statistics do not take into account external

stimuli which could change the over-all picture, Mr. Gainsbrugh emphasized. Any could change it. Activity on Capitol Hill indicates the growing likelihood of:

1. Tax relief in all forms, including depreciation, to boost purchasing power.
2. A stepup instead of a decrease in government outlays for defense.
3. An early shift toward easier money—the administration's biggest family squabble.

### Plots Market Growth

W. W. Morris, director of market planning, Westinghouse Electric Corp., Pittsburgh, probably would be in essential agreement with Mr. Gainsbrugh, if his comments before the Fourth Pitt Conference on Business Prospects are any indication. He feels that gross national product will advance from this year's predicted \$435 billion to about \$445 billion, but that the Federal Reserve Board's industrial production index will decline from the 145 average (1947-49=100) expected this year to 144 in 1958.

He sees continued growth for the major markets of the electrical

machinery and appliance industry, predicting:

**Electric Utility Apparatus** — Sales will increase from \$2.15 billion this year to \$2.36 billion in 1958. New orders will exceed this year's by 8 to 10 per cent.

**Industrial Goods**—Sales of electrical goods to industry next year will approximate this year's \$2.6 billion.

**Construction**—Sales will drop 3 to 5 per cent under this year's \$5 billion mark even though this activity will continue at present high levels. The product mix in building next year will work against any increase here.

**Appliances** — Sales will regain the 1956 level, which will mean an increase of about 4 per cent over the 1957 level.

**Defense** — Continued growth is the prospect as missiles come into their own. Next year should witness a volume of over \$5 billion.

The plusses will outweigh the minuses in 1958, Mr. Morris thinks, resulting in an increase of 2 to 3 per cent in total sales.

## Construction: Prop in '58?

As in the last few years, economists are expecting the construc-

tion industry to be one of the main props under the economy in 1958. Two authorities have come up with predictions which are worthy of note if for no other reason than their similarity.

Thomas S. Holden, vice chairman of F. W. Dodge Corp., New York, predicts an increase of 5 per cent in construction contracts for 1958. Theodore J. Taylor, manager, Financial Analysis Dept., Pittsburgh Plate Glass Co., Pittsburgh, thinks total expenditures for construction will hit \$49 billion, 5 per cent above this year's expected \$47 billion.

Here's how their expectations compare in some important areas: Housing starts: Mr. Holden, 1,075,000 units; Mr. Taylor, 1,050,000. Commercial: Mr. Holden, 4 per cent decline in floor area; Mr. Taylor, "slightly slower." Industrial: Mr. Holden, off 6 per cent; Mr. Taylor, off as much as 8 to 10 per cent. Utilities: Mr. Holden, up 7 per cent; Mr. Taylor, up 15 per cent. Both feel that highway construction and educational, hospital, and religious building will peak in 1958.

Construction contract awards through September were 2 per cent ahead of a year ago, Dodge says.

Joy Mfg. president

**ALBERT C. WEDGE**  
DeWalt v. p.-mfg.

Lafayette E. Hammond was elected president, Lehigh Inc., Easton, Pa. Former chief engineer, he succeeds Alvin A. Shumann, named chairman of the finance committee. Leroy M. Bissett and Clayton L. Coulter were elected vice presidents. Mr. Bissett continues as general manager of Lehigh Mfg. Co., refrigeration products division. Mr. Coulter is now in charge of purchasing.

Eastern Stainless Steel Corp., Baltimore, named James W. Stottlemeyer sales manager. Martin J. Bartholomey was made assistant to the sales manager; David E. Russell, manager of customer service.

John E. Rowe fills the new post of executive vice president, Tomkins-Johnson, Jackson, Mich. He was vice president of Ross Operating Valve Co. William J. Remund was promoted from sales manager to the new post of vice president-sales. Adam P. Janowski was made sales manager; Robert L. Curtis, assistant sales manager.

Mark A. Norcott was made manager of aluminum sales for Korhmel Steel & Aluminum Co., Evanston, Ill. He has been with the company four years in a sales capacity.

Raymond Schiff joined Yellow Springs Instrument Co., Yellow Springs, Ohio, as sales manager. He was product line sales supervisor for electrochemical instruments, Beckman Instrument Co.

W. L. Wearly was elected president, Joy Mfg. Co., Pittsburgh, to succeed John Lawrence, resigned. A. B. Drastrup succeeds Mr. Wearly as executive vice president.

Kendrick R. Wilson Jr. was elected president of Avco Mfg. Corp., New York, to succeed Raymond A. Rich, who resigned to serve the company as a consultant. Mr. Wilson was vice president.

Denzil Hawkins and Theodore Rancont were named vice presidents of Producto Corp. They continue as branch managers in their respective cities—Mr. Hawkins at Dayton, Ohio; Mr. Rancont at Detroit.

Carl J. Bliemeister was named purchasing agent for A. O. Smith Corp.'s Granite City, Ill., auto frame plant. He was a member of the company's central purchasing department in Milwaukee.

Norman L. Peukert was made director of sales engineering and development, Carondelet Foundry Co., St. Louis. He was general superintendent.

Leon Weiss joined Preco Inc., Los Angeles, as product sales director. He was sales manager, power products division, C & C Super Corp., New York.

John P. Moffatt Jr. was made director of quality control, central manufacturing division, Consolidated Electrodynamics Corp., Pasadena, Calif. He succeeds A. P. Stuhrman, now division manager.

Albert C. Wedge was elected vice president-manufacturing, DeWalt Inc., Lancaster, Pa., subsidiary of American Machine & Foundry Co. He was production superintendent.

Jerome S. Stanford joined Olin Mathieson Chemical Corp. as executive assistant to the vice president-sales of Olin Aluminum, New York. He was vice president of Varcum Chemical Corp., Niagara Falls, N. Y.

Gordon Austin, sales representative in Philadelphia for Republic Steel Corp.'s Berger Div., was transferred to sales headquarters in Canton, Ohio, to head promotion and sales of new material handling products developed in Berger's shelving department.

D. N. Frey, formerly director of engineering research, Ford Motor Co., Dearborn, Mich., was made executive engineer, Ford Div. car product engineering.

Carl N. Furay was appointed southeastern head of Howard Foundry Co.'s design engineering field service. He was a chief engineer of a design group for Pratt & Whitney Aircraft, division of United Aircraft Corp.

York Corp., York, Pa., subsidiary of Borg-Warner Corp., named Robert G. Werden general sales manager of engineered equipment; Robert E. Cassatt, general sales manager, packaged products; M. S. Lehair, assistant vice president-marketing; Walter L. Pharo, gen-

eral sales manager, contract products.

**David G. Collins** was named vice president, **SpeedWay Mfg. Co.**, Cicero, Ill., subsidiary of **Thor Power Tool Co.** He is in charge of the electric motor division. Mr. Collins was sales manager of the **SpeedTool** division.

**Douglas M. Park** was named purchasing agent of **Associated Spring Corp.'s** B-G-R Div., Plymouth, Mich. He replaces **Norman R. Gardner**, assigned to cost accounting work in the divisional comptroller's office. Mr. Park was factory manager, **Wallace Barnes Co. Ltd.**, Hamilton, Ont., Canadian subsidiary.

**Richard B. Loynd** was named merchandise sales manager, **Emerson Electric Mfg. Co.**, St. Louis.

**Harry Cramer** was named assistant sales manager, **John S. Barnes Corp.**, Rockford, Ill. He will direct sales of company products made for automotive and other mass production industries.

**Ralph Fifield** was made manager of the Los Angeles branch of **Binks Mfg. Co.**, Chicago.

**Warren Gressle** was made a sales engineer for aircraft products division, **Cooper Alloy Corp.**, in Clark Township, N. J.

**Frank N. Nolan** was made superintendent of maintenance, **Buffalo steel plant**, **Republic Steel Corp.**

**P. J. Baltes** was made Ohio district sales manager, **Duff-Norton Co.** He is at Cleveland.

**Kenneth W. Bruland** was named superintendent of **Alan Wood Steel Co.'s** new iron powder plant, to be constructed at Ivy Rock, Pa. For the last six years, he has been engaged in company research on development of iron powder production methods and processes.

**Boyce M. Hill** was made sales manager, hydraulic division, **Parker Aircraft Co.**, Los Angeles, subsidiary of **Parker-Hannifin Corp.**

**M. E. Loose**, assistant purchasing agent, was made manager of the purchasing division of **Ohio Oil Co.**, Findlay, Ohio. He succeeds **Earl W. Shoupe**, retired. **E. T. Snyder**, also assistant purchasing agent, was made purchasing agent. The changes will be effective Dec. 1.

**Lewis G. Woods** was made director of supply and inventory, **International Harvester Co.**, Chicago, to succeed **Mercer Lee**, vice president, who retired.

**W. H. Stewart** was appointed Seattle district manager, **ElectroData Div.**, **Burroughs Corp.** He succeeds **Meade C. Camp**, now Philadelphia district manager.

**C. E. Flora** was made manager of industrial sales, **Davey Compressor Co.**, Kent, Ohio. He was compressor division manager, **Binks Mfg. Co.**

**P. Howard Farley** was made manager, distributor and contractor sales, **Anaconda Wire & Cable Co.**, New York, subsidiary of **Anaconda Co.** Mr. Farley joined **Anaconda Wire & Cable** last year as manager-contractor sales. For three years

previously, he was sales promotion manager and also director of marketing for the **National Electrical Contractors Association**.

**George T. Hubbell** was elected president and **T. Mark Keefe** executive vice president and treasurer of **Seymour Mfg. Co.**, Seymour, Conn. Mr. Hubbell presently is serving as president of **American Refractories & Crucible Co.** Mr. Keefe was an executive of **Mul-lite Refractories Co.**

**C. T. Stott** was named to succeed **C. E. Clarke**, retired, as general manager of the **Sparrows Point**, Md., plant of **Bethlehem Steel Co.**

**J. Barrie Graham** was made director of research for **Buffalo Forge Co.**, Buffalo.

**Charles R. Claxton** was named assistant chief engineer, nuclear projects division, **Stone & Webster Engineering Corp.**, Boston.

**L. E. Jolls** was made manager, quality control department, tractor and implement division, **Ford Motor Co.**, Birmingham, Mich. He succeeds **W. R. Phillips**, now production manager of the **Des Moines**, Iowa, implement plant.

**Gerald A. Stone** succeeds **Edward G. Wendell**, retired, as district manager of the Dallas office and factory branch store of **Link-Belt Co.** **William R. Palmer** replaces Mr. Stone as district manager of the **Shreveport**, La., office.

**Arthur A. Cline** was made technical control manager, electrode division, **Great Lakes Carbon Corp.**, at Niagara Falls, N. Y.

**Square D Co.** named **Daniel H. Miller** manager of the western division, with headquarters at Los Angeles.

**A. Gregg Noble** was made assistant to the director of operations, **Solvay Process Div.**, **Allied Chemical & Dye Corp.**, Syracuse, N. Y.

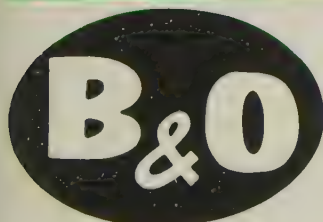

**James M. Stuart** was named a vice president of **Reynolds Aluminum Sales Co.** and made general manager of the eastern sales region of the parent **Reynolds Metals Co.** He is at New York. **Harry J. Williams**, formerly general sales manager-eastern region, was made

James P. McNally was named product manager of the new Philadelphia plant of Arcflux Corp., subsidiary of Arcos Corp. He was superintendent with Union Tank Car Co. Previously he had been sales manager, Bart Mfg. Corp., and production metallurgist, Carrier Corp.

Joseph O'Reilly was made general manager, Ferroxcube Corp. of America, Saugerties, N. Y., a subsidiary of North American Philips Co. Inc.

Sales representatives appointed by the steel division of Copperweld Steel Co. included Kenneth L. Kinser, made Indianapolis district sales manager, and Ralph E. Barcus, Milwaukee sales manager. James D. McKinnon and Preston C. Patch were named to the Chicago sales office.

Ralph J. Bannon was elected president and chairman, Bannon & Co., San Diego, Calif.

Valvair Corp., Akron, Sinclair-Collins Valve Co., elected W. F. Kruspe president and general manager to succeed J. E. Collins, now chairman. Mr. Kruspe was executive vice president.

Clifford A. Buehrens was made assistant manager of the Lorain, Ohio, yards of American Ship Building Co. He was with Christy Corp.

Dr. Clarence A. Stiegman was named technical director; Dr. J. Howard Brown, general manager, research and development, at Hooker Electrochemical Co., Niagara Falls, N. Y. Dr. Johannes H. Bruun, director of research and development, has resigned.

Duane S. Seavey, general sales manager, was appointed executive vice president of Ralston Steel Corp., Skokie, Ill.

John E. Flickinger was named sales manager, electronics division, General Controls Co., Los Angeles.

Charles A. Woodley was elected executive vice president, Caterpillar Tractor Co., Peoria, Ill. He continues direction of the manufacturing division. He was a vice president.

A. F. Skipp Jr. was made sales manager, Herr Equipment Corp., Warren, Ohio. He joined the firm in 1956 as sales engineer. He formerly was with Westinghouse Electric Corp.

Theodore B. Russell, former manager of bridge sales, Pittsburgh-Des Moines Steel Co., was elected vice president of Mount Vernon Bridge Co., Mt. Vernon, Ohio.

George E. Kuck was made manager, metallurgical instruments division, Intercontinental Electronics Corp., Mineola, N. Y. He was manager of the materials laboratory of Avco Mfg. Co.'s Lycoming Div.

Russell F. Derr was made assistant general sales manager, Jones & Laughlin Steel Corp. He has been Detroit district sales manager for Pittsburgh Steel Co. In his new post with J&L, his offices are in Detroit.

Louis R. Garza was made manager of the international division of F. J. Stokes Corp., Philadelphia. He was export manager, Henry Disston Div., H. K. Porter Company Inc.

## OBITUARIES...

Forrest C. Clough, 73, president, Federal Gear Inc., Cleveland, died Oct. 30.

Leroy Salsich, 78, former president of U. S. Steel Corp.'s Oliver Mining Div., died Oct. 26 in Duluth.

Joseph J. White Jr., metallurgical and research associate at Erie Forge & Steel Corp., Erie, Pa., died Oct. 20.

John R. Voigt, 45, Milwaukee district manager, Moody Engineering Co., died Oct. 20.

Oscar H. Schildknecht, retired sales manager, Maynard Electric Steel Casting Co., Milwaukee, died Oct. 26.

# Tubes by the Mile

New mill installed at Chase's Cleveland plant draws copper tubing up to 9000 ft long

AN AUTOMATED copper tube mill is operating at the Cleveland plant of Chase Brass & Copper Co., a subsidiary of Kennecott Copper Corp.

Completion of this multimillion dollar expansion program, begun in 1955, provides uninterrupted production of copper tubing from billet to finished tube, on electronically controlled, high speed machines.

**Apparatus**—Equipment includes a 400-ft drawbench capable of simultaneously drawing five 43-ft tubes to straight lengths up to 210 ft. Another feature is a magnetic defect detector that performs critical internal and external inspections. Continuous production of nonwelded lengths of copper tubing up to 9000 ft long has been attained in the plant.

The new mill is housed in a 234,000 sq-ft addition to Chase's Babbitt Road plant, which also produces brass and copper rods and bars in adjoining sections. Sheets and strip of brass and copper are made in Chase's nearby Euclid plant.

## Opens Engineering Center

A new center for the Engineering & Construction Dept., Electro Metallurgical Co., a division of Union Carbide Corp., has been formally opened at Niagara Falls, N. Y.

The six-floor building has 49,000 sq ft of floor area. It features air conditioning, fluorescent lighting, self-service elevators, stainless steel trim, and vinyl floor tile. Employment is 170.

## Reynolds Forms New Firm

Reynolds Metals Co., Richmond, Va., formed a wholly owned Australian subsidiary, Reynolds Pacific Mines Ltd., with headquarters in Melbourne. Richard S. Reynolds Jr., Reynolds' president, is chairman of the subsidiary. Walter L. Rice is its president.

The company was formed to ac-

## Gadsden's New Strip Mill

This 54-in. temper mill is part of a strip mill installed by Republic Steel at Gadsden, Ala. Other equipment includes a 54 in., hot strip mill; a 54 in., 3 stand, tandem cold mill; a continuous pickle line; a 48 in., continuous galvanizing line; 48 in. cold cutting and hot cutting lines; a multiple slitter; and annealing facilities

quire bauxite deposits and other raw materials in quantities large enough "to ultimately justify establishment of an integrated aluminum industry in Australia."

## Introduces New Alloy

Kawecki Chemical Co., Boyertown, Pa., is introducing a 2.75-3.25 per cent boron-aluminum alloy, complementing its present 1.50-2.25 per cent alloy. In addition, the company announced 5.0-6.0 per cent boron-aluminum, 5 and 10 per cent tantalum-aluminum, and 5 and 10 per cent columbium-aluminum are available in limited quantities for research and development programs.

## Builds Research Center

Hooker Electrochemical Co., Niagara Falls, N. Y., is building a research center on Grand Island, N. Y. To be completed in about 15 months at a cost of \$3.5 million, it will provide space for about 200 employees.

The 69,000 sq-ft building will be situated on a 61-acre tract. It will have research labs, administration and stenographic sections, a libra-

## If you operate a CUT ACID REQUIREMENTS

New continuous process, available from Koppers,  
of pickling acid used . . . and eliminates waste

FOR OVER A QUARTER OF A CENTURY, wherever a pickling line has been in operation, disposal of spent liquor has been a major headache. But now a new continuous regeneration process—the Koppers Inland-Zahn process—goes a long way toward solving this problem. This system is simple, it is economical, and it has been proved in actual plant-scale commercial operation in Europe.

With this process, the only make-up acid needed is the amount consumed in the pickling reaction plus normal losses. All available free acid in the used liquor is recovered (up to 50% of the original charge). Labor costs are low—just one man can operate the entire regeneration plant. As a result of these savings, operating costs are substantially below those of any presently available disposal method.

# pickling line

## IN HALF!

regenerates up to half  
liquor disposal problem

**PROVED COMMERCIALY**—This process, developed by Inland Steel Company and adapted commercially by Zahn & Co. of West Germany, is now being used successfully in three European steel plants. The benefits achieved include *extremely low maintenance* . . . and more uniform and *higher acid concentrations* in the baths. The latter advantage permits faster steel processing.

**NEUTRALIZING PLANTS** — The new regeneration process is especially applicable to plants handling 10,000 gallons of effluent, or more, a day. The Chemical Department of Koppers Engineering and Construction Division also designs and builds lime neutralization systems for both large and small pickling operations. Send the coupon for complete information about these and other Koppers Chemical Engineering Services.

Spent pickle liquor (1) is pumped (2) to spray head in an evaporating chamber (3). Here, hot air and flue gases from a combustion chamber (4) concentrate the liquor and cause the ferrous sulfate monohydrate to crystallize out of solution. Vapor laden air is discharged to atmosphere through a mist eliminator and stack (5 and 6). The slurry is dropped into a crystallizing tank (7) where fresh sulfuric acid is added from a metering tank (8). This causes more monohydrate to drop out. The slurry is then separated in a vacuum filter (9) and washed. Salt is conveyed to bins or hopper cars for sale or disposal (10, 11, 12). Mother liquor, containing about 35% acid and 1-2% iron, is pumped to a holding tank (13), ready for dilution and return to the pickling tanks. No reheating is required.

**HEART OF THE SYSTEM**—This spray dryer concentrates spent liquor to slurry of ferrous sulfate monohydrate crystals suspended in acid. The plant shown here, in Germany, has operated since June, 1954, processing 48,000 gallons per day of waste liquor.

### GET ALL THE FACTS!

# "PERMA-NUTS" GIVE "QUICK-CHANGE" FEATURE TO ABRASIVE ASSEMBLIES

## *Tubular's* PERMA-NUTS AND RIVETERS HELP DAYTON ABRASIVE PRODUCTS, Inc.\*

### PERMA-NUTS Do Double Duty

Dayton uses *Tubular's* PERMA-NUTS to permanently fasten its abrasive assemblies and at the same time provide a threaded fitting. This allows the assembly to be quickly spun on or off of a power-tool mandrel and gives the product a special sales advantage. Dayton saves assembly time by using *Tubular's* Riveting Machines. They are made to automatically feed and set PERMA-NUTS.

### \* DAYTON ABRASIVE of Dayton

Dayton Abrasive Products, Inc., in twelve years has become one of the country's leading manufacturers of abrasive specialties. "Ingenuity," as evidenced by the adaptation of PERMA-NUTS to Dayton's "Spinner Settings®," may be considered a primary ingredient of the company's success.

### TUBULAR of Quincy

When fast, automatic, economical, permanent fastening of your assemblies is the problem, turn to *Tubular*. We have the rivets, the machines and the experience. For further information and technical help call our nearest office or send us your blueprint or sample assembly. A special Design Bulletin on PERMA-NUTS is available for the asking.

ry, glass blowing shop, a services section, and cleaning and storage areas. Other facilities include an infrared lab, physical, chemical, analytical, and distillation labs.

## Buying Refinery Site

Kennecott Copper Corp. will buy 200 acres near Baltimore from the B. & O. Railroad to build an electrolytic copper refinery costing about \$20 million. It will open in 1959 with an initial monthly capacity of 7000 tons and will employ about 450.

Blister copper will be supplied by Braden Copper Co., a Kennecott subsidiary in Chile. Some refined copper will be marketed in Europe.

Facilities will include two main buildings, plus an office building, warehouse, and service installations. New copper casting and material handling equipment also will be added.

## ASSOCIATIONS

As a result of a complete reorganization, the Drop Forging Association, Cleveland, will henceforth function through five division councils. Chairmen of the councils, composed of five to nine members each, are: Victor Brown, Kropp Forge Co., Chicago, marketing and education; W. A. Frazee, Steel Improvement & Forge Co., Cleveland, industrial relations; L. M. Fehrenbach, Indianapolis Drop Forging Co., Indianapolis, engineering and production; Victor F. Braun, Ladish Co., Cudahy, Wis., legislation and government relations; and W. A. Carlile Jr., Columbus Bolt & Forging Co., Columbus, Ohio, management aids.

Foundry Equipment Manufacturers Association Inc., Washington, elected these officers: President, Gordon E. Seavoy, Whiting Corp., Harvey, Ill.; and vice president, E. A. Borch, National Abrasive Co., Cleveland. C. R. Heller was re-elected executive secretary-treasurer.

Newly elected president of the National Association of Sheet Metal Distributors, Philadelphia, is

## Nuclear reactor heat exchanger tubing must not fail

*That's why Superior tubing is specified*

When the count starts rising in a nuclear pile and the reactor goes critical, the heat exchanger begins its vital function. Reactor heat exchangers require tubing of the highest quality.

This tubing must offer rapid and efficient heat transfer. It must be bright and clean, with extremely smooth ID and OD surfaces for uninterrupted fluid flow. Walls must be uniform throughout—no heavy sections to slow down heat transfer, no thin spots where scaling

or corrosion might gain a foothold. Ductility is also important for fabrication ease. Excellent weldability is a prime requirement.

Superior has been supplying high quality tubing in a wide variety of analyses and sizes to heat exchanger manufacturers for many years. We produce to the most exacting tolerances and specifications. Get more information and free literature today on Superior tubing for atomic power. Write Superior Tube Company, 2005 Germantown Ave., Norristown, Pa.

**Gears with long useful lives . . .**  
**the result of *high quality*\* at H&S**

- \* **Quality materials**
- \* **Modern tooling**
- \* **Superior workmanship**

Highly appreciated by the paper mill industry, for instance, are the large spur gears such as the one shown here. This gear has 140 teeth of 2 diametral pitch and 8" face. It is being completed on a 100" Fellows Gear Shaper that generates high quality external and internal spur gears up to 8" face and 1½ D.P.

The modern Horsburgh & Scott plant is equipped with many new precision tools to meet today's demand for higher quality industrial gearing. You can judge our ability to serve you by these examples of size range:

- Spur gears up to 156" diameter
- Helical gears up to 100" diameter
- Sykes Herringbone gears up to 60" diameter
- Bevel gears up to 77" diameter
- Worm gears up to 60" diameter

You benefit by the exacting care that we exercise in every manufacturing step. Tell us your requirements; quotations will be sent by return mail.

A request on your company letterhead will bring a copy of the new H&S Gear Catalog 57 to help you design and order industrial gears.

L. F. Demmler, Demmler Bros., division of Anchor Sanitary Corp., Pittsburgh. Vice presidents are: A. B. Lewis, Palmer-Donavin Mfg. Co., Columbus, Ohio; and J. J. Worley Jr., N. B. Handy Co., Lynchburg, Va. T. A. Fernley Jr. is executive secretary.

**National Tool & Die Manufacturers Association**, Cleveland, elected these officers: President, P. R. Marsilius, Producto Machine Co., Bridgeport, Conn.; first vice president, Jack Kleinoder, Volkert Stampings Inc., Queens Village, N. Y.; second vice president, H. G. Murdock, Arrowsmith Tool & Die Corp., Los Angeles; treasurer, R. C. Renner, East Dayton Tool & Die Co., Dayton, Ohio; and secretary, James A. Perdy, Atlantic Mfg. Co., Philadelphia.

### **NEW ADDRESSES**

Sales Promotion Dept. of Electro Metallurgical Co., a division of Union Carbide Corp., moved to the fourth floor of a building at 535 Fifth Ave., New York 17, N. Y.

Reserve Mining Co. moved its public relations office from Duluth to the company's general office building in Silver Bay, Minn. Edward Schmid is director of the department.

U. S. Steel Corp., Pittsburgh, will consolidate the headquarters offices of its United States Steel Homes Div. in the Frick Bldg., that city. Manufacturing operations in the New Albany, Ind., and at the division's second plant in Harrisburg, Pa., will continue undisturbed.

### **CONSOLIDATIONS**

Anaconda Co., New York, will acquire the Cochran Foil Co., Louisville, subject to approval by Cochran stockholders.

American Can Co., New York, and Marathon Corp., Menasha, Wis., will merge, subject to approval by stockholders. American Can makes metal and fiber con-

tainers; Marathon produces pulp, paper, and paperboard.

Jefferson Electric Co., Bellwood, Ill., producer of electrical components, will purchase Electronic Products Corp., Santa Barbara, Calif., subject to approval by the latter's stockholders. The California firm is a major manufacturer of custom cables and electronic assemblies for the guided missile industry.

Peninsular Distributing Co., Detroit, purchased Rayl Industrial Supply, a division of Rayl Co., that city, and made Leonard F. Joseph division manager.

## NEW PLANTS

Central Screw Co., Chicago, opened an 80,000 sq-ft plant at Frankfort, Ky. The firm also has awarded contracts for tripling its facilities at Los Angeles. Central is a major supplier of cold-headed fasteners (machine and tapping screws, lock washer assembly screws, and allied products).

Dooley Steel Corp., San Diego, Calif., constructed a 15,000 sq-ft plant adjacent to existing facilities. It will increase production capacity by 80 per cent.

Victor Equipment Co., San Francisco, acquired additional frontage adjoining its plant on Folsom Street. This will enable the firm to expand its facilities at the main plant. Victor also is constructing a building at the rear of the Folsom Street property.

Joseph T. Ryerson & Son Inc., warehousing subsidiary of Inland Steel Co., formally opened its steel service plant at Mt. Holly and Chemway Roads, Charlotte, N. C. It replaces the former leased quarters in the city. The new facility represents an investment of over \$1 million for building and equipment, including a high speed friction saw for cutting structural steel, plate and sheet shears, hacksaw, bar and angle shears, and mechanized flame cutting equipment. Wilson A. Young is general manager of the new plant.

New band mill introduces major time savings in machining large work pieces.

## Blessed Event for Everyone

Fantastic growth opportunities lie ahead for the American economy—if the development and use of newer, better “tools” can be accelerated. This requires a more widespread understanding that the birth of a better, faster tool is a blessed event of real significance to everyone . . . and that such tools are created only by the savings of the thrifty and the profits of business.

The picture above illustrates the principle. A new machine tool, called a band mill, is being used to reface a die block that forms washing machine parts. This machine tool employs a thin continuous-cutting saw band, made of high speed steel, which rapidly and accurately “slices off” the unwanted metal. The band mill does the die block job in about half the time required by previous machines.

The band mill opens up many opportunities to effect major savings in time, material and labor in the machining of work pieces measuring up to 18" high by 26" wide and weighing up to two tons.

With such a tool a man can turn

Better home laundry equipment at a price people can afford—thanks to better tools like the band mill illustrated.

out more work per hour. Thus, he can produce the greater volume of goods and services required for a growing population and a higher standard of living. And, when enough of such tools are “born” and put to work, better living for more people will be possible. It's as simple as that. Good living, short hours and high wages depend on individual productivity. Only with more and better tools can people increase their productivity.

Reprints of this series on economics plus “economic kits” available for employee education.

# the steel you want *flame-cut* to your specifications

You can have as much—or as little steel as you need,  
on a moment's notice, from your J & L Steel Warehouse.  
You can order J & L steel plates flame-cut to *your*  
specifications—and save on machining time, reduce your  
inventory and handling costs, and increase your  
factory production space. It's smart business to use your  
J & L Steel Warehouse as your Department Store of Steel.

## CONCEPT IN FORMING

## NILSON VERTIFORM

Our LATEST DEVELOPMENT—  
Applying 4-Slide Forming Techniques To A Vertical Machine.

Designed For Rapid Tooling  
Set-Up And Ease Of Operation.

### MACHINE SPECIFICATIONS #V-187

- Max. diam. wire—\_inches ..... .187
- Max. length of feed—standard 15"
- Max. length of feed—with change gears ..... 30"
- Max. width ribbon metal ..... 1 1/4"
- Stroke of forming slides ..... 2 1/2"
- HP. required ..... 2
- Machine speed—standard 30-120 RPM
- 4 and 20 ton Press Attachments available.

### ADVANTAGES OF THE NILSON VERTIFORM

1. Greater Tool Accessibility
2. Unobstructed View Of Product Being Formed
3. Forming Slide Units Removable and Interchangeable
4. Less Floor Space Required
5. Operator Safety (Most Moving Parts Enclosed)
6. Automatic Oiling Of Entire Machine

## Program for Management In 1958

The small business article beginning on the opposite page concludes our ten-part Program for Management—1957. STEEL's 1958 series begins Feb. 17.

The theme of next year's program will be: Planning for profit in a high-plateau economy. Ten articles will deal with profit planning in marketing, production, engineering, research, labor relations, and other management areas.

● The 1957 articles are:

1. **The Care and Feeding of the Junior Executive**  
(Feb. 11, Page 93)
2. **Grooming Middle Managers**  
(Mar. 18, Page 93)
3. **Profit Sharing**  
(Apr. 15, Page 115)
4. **Inventory Management**  
(May 13, Page 109)
5. **Managing Our Markets**  
(June 17, Page 93)
6. **Research: Threshold to the Future**  
(July 15, Page 93)
7. **Producing for the New Technology**  
(Aug. 12, Page 113)
8. **Dealing with Workers**  
(Sept. 16, Page 119)
9. **Make or Buy?**  
(Oct. 14, Page 105)
10. **Small Business: Its Place in Our Future**  
(Nov. 11, Page 99)

Extra personal copies of these Program for Management articles are available until the supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

# Small Business

## Its Place in Our Future

A SURFEIT of sentimental nonsense has been written about small business, but only crepe hangers have any reason to fear a realistic diagnosis of the facts.

The patient will live. In fact, he really isn't sick. He has aches and pains here and there, but who hasn't?

**Evidence**—You don't have to go any farther than the small businessman himself to confirm that view.

Dun & Bradstreet Inc. did to get information for the President's

Conference on Technical & Distribution Research for the Benefit of Small Business in Washington this fall.

Here are the answers it got:

Four out of five small businessmen think they have made progress; three out of four say they will continue to grow; only two out of every 100 intend to liquidate (see Pages 102 and 103).

**Observation**—The survey prompted J. Wilson Newman of D&B to make these remarks:

"On the basis of the information,

I am tempering my views of the charge that the little man in business is fighting a losing battle for survival . . . I believe we have permitted the complaints of a minority to color our concept out of all resemblance to the facts. There are some justifiable complaints against unfair competition; there may be some glass-eyed bankers who turn down good loans; there are suppliers of merchandise who are guilty of discriminatory and unethical practices, but the decibel rating of the complaints is out of

# Small Metalworking Plants Double in Number

SIZE OF PLANTS (Number Employees)		1946	1947	1948	1951	1952	1957

SMALL PLANTS	100-499 . . . . .	5,359	5,543	5,520	5,796	5,863	7,982
	50-99 . . . . .	3,614	4,411	4,294	4,503	4,503	6,340
	20-49 . . . . .	3,747	4,519	4,580	8,341	8,341	9,640
	Plan's 20-499 . . .	12,720	14,473	14,394	18,640	17,707	23,962
	% of all plants . .	84%	89%	87%	89%	89%	89%

Sales of small plants (employing less than 500) as a percentage of sales for all metalworking plants employing 20 or more has stayed at about a steady 30 for more than a decade. Figures on organizations employing less than 20 aren't included because they aren't available for every year. Source: STEEL and Census Bureau.

all proportion to the evidence we find in the market places of the nation."

Adds S. S. Inch, vice president and director of sales for Kaiser Aluminum & Chemical Corp.: "Big business 'versus' small business has almost become a cliché . . . I believe the vast majority of businessmen, no matter what size business they represent, do not feel or act in a manner that justifies the implications of the word 'versus.'"

**More Evidence**—Statistics can be used to perpetuate the "versus" myth.

This set of raw figures, for example, may give you a general impression that is misleading: The nation has 4.3 million businesses; 4 million are small, each employing, roughly, less than 500. They represent only 65 per cent of the work force and account for only 45 per cent of gross sales dollars.

More realistic information may be obtained by looking at an industry. Data in the table above, for example, show that small metalworking firms account for 89 per cent of the industry's business population now, compared with 84 per cent in 1946. Their percentage of industry sales has stayed at a steady 30 per cent for over a dec-

ade. During the same period, their percentage of industry employment has held at around 35 per cent.

**Down to Brass Tacks**—Some business problems are universal. Some are related to the size of the enterprise, whether it is large or small.

At the Washington conference, three groups were asked to rate the basic problems of small firms. Executives from large companies put research and development needs at the top of the list; they rated personnel and financing next. Government leaders said financing was first, then personnel and research. Small businessmen thought financing problems led the list; they rated personnel, marketing, and research troubles next. All three groups put production and government relations problems at the bottom.

Let's take a closer look at how small business can better cope with financing, personnel, marketing, research, government relations, and production.

## Financing

Acquire a good relationship with a banker, advises Clifford D. Coop-

er, president of Cooper Development Corp., Monrovia, Calif. "I have always used my banker as an adviser and found him most helpful," he says, "as long as I took him into my confidence and my planning."

A good idea is to "plan the work—then work the plan." Make up a budget and cash forecast for several months, showing your estimated sales, costs, expected profits, amount needed in bank loans. Allocate the amount of funds available, if any, to spend for fixed assets. When you plan the work like that, your chances of borrowing money are improved, so you can work the plan.

**Borrow for the Future**—It's a legitimate way of conducting business, although many a small businessman still has scruples about it. Young presidents don't. Three of four firms whose chief executives belong to the Young Presidents organization borrowed last year. Five of seven got short-term money with ease. Two of five, however, couldn't get enough long term financing.

Your local commercial bank is the first place to apply. If you don't succeed, try a commercial paper house, factor, industrial fin-

nance company, personal finance company, investment banker, or, last, the Small Business Administration.

**Search for Capital**—The investment banker is too often neglected by small business, but he may be able to help more than any other financial agent by finding outside capital. That's often a little company's primary problem, although the owner does not or will not admit it. Outside capital can aid growth, expand the credit base of the company, reduce risk by dividing ownership, provide directorships that bring additional valuable management counsel.

Concentrated ownership, when the stock is not listed publicly, narrows the credit base for loan purposes. "Owning part of a thriving business is better than owning all of an ailing one," says William Crane of Saunders, Stiver & Co., Cleveland investment house.

The National Association of Securities Dealers, Washington, lists 3757 members. Throughout the country, they are in close touch with each other and keep tab on venture or investment capital. The cost of this type service is geared to the accomplishment. A fee is charged only if the venture succeeds.

**Hunt for Cash** — SBA is the court of last resort. Its loans are made to: 1. Finance construction, conversion, or expansion. 2. Finance the purchase of equipment, supplies, or materials. 3. Supply working capital.

To be eligible, a firm must be: 1. Independently owned and operated. 2. Not dominant in its field. 3. A small business employing less than 250, or between 250 and 1000, depending upon the standard SBA has adopted for that industry. 4. Able to repay from income. 5. Unable to get private financing.

The maximum loan is \$250,000. Usually, a decision is reached within three weeks after application.

## Personnel

A survey of ten small companies by the American Management Association reveals that 50 per cent thought their most serious difficulties were related to personnel.

A maker of steel kitchens employing 320 can't progress in personnel development and executive replacement. A structural steel fabricator with 100 workers is struggling to move away from one-man management. A foundry employing 625 finds its biggest challenge is recruiting potential managers. A producer of building supplies, with 125 employees, finds trouble in assigning special jobs to company officers. A 115-employee machinery maker has had little success developing a team operation.

**All in the Boat**—Every company, regardless of size, has personnel troubles. But a small firm's difficulties are special because its management has to be a one, two, or three man band. The owner tends to be a do-it-yourselfer, somewhat scornful of highfalutin

ideas such as management training.

Yet even small companies must do more recruiting and training of management personnel. James G. Garwick, regional director in Cleveland for SBA, suggests:

1. In recruiting, try the smaller colleges; also be on the lookout for some bright young man with experience who is tired of the institutionalized features of big companies.

2. Watch out for the specialist—he's usually not for you.

3. Start training by putting a blue collar on your prospect. Send him through all operating functions of the shop.

4. Then send him out to sell.

5. After that, put him to work with the head of each department.

6. Keep him informed of his progress and where he's headed.

7. Give him a problem. Better,

## Small Plants Do \$47 Billion In Metalworking Business

SIZE OF PLANTS (Number Employees)	NUMBER OF PLANTS	PER CENT OF PLANTS	PER CENT OF BUSINESS POTENTIALS*
500 or more . . . . .	2,385	3.5	65.6
250-499 . . . . .	1,994	2.9	10.6
100-249 . . . . .	4,214	6.2	9.9
50-99 . . . . .	5,193	7.6	5.3
20-49 . . . . .	10,412	15.3	4.7
10-19 . . . . .	10,345	15.2	2.0
5-9 . . . . .	10,929	16.0	1.1
1-4 . . . . .	22,731	33.3	.8
TOTAL . . . . .	68,203	100.0	100.0

\*Percentage of business potential is arrived at by averaging the percentage of value added by manufacture and the percentage of total employment. Plants employing 1 to 499 did 34.4 per cent of the metalworking business in 1954, the latest year for which Census Bureau figures are complete enough to make the calculation. That 34.4 per cent applied to 1957's expected \$138 billion metalworking volume puts small business' share at \$47 billion.

# What Small Business Thinks

## 1. What has been the history of your business over the last five or ten years?

Has grown .....	84.5%
Has gone backward ..	4.7
Has stood still .....	10.8

## 2. How do you rate your company's future?

It will grow .....	82.9%
It will go backward ..	3.9
It will stand still ....	12.4
Don't know .....	0.8

## 3. What's your strongest asset?

Nothing in particular	25.9%

Quality of products and service .....	17.2
Ability, reputation, and experience ....	14.7
Competent personnel ..	4.3
Equipment and facilities .....	7.7
Flexibility .....	6.0
New products .....	5.2
All other .....	4.3

(Percentage of replies from 126 manufacturers interviewed by Dun & Bradstreet)

let him find one. If he solves it efficiently, head him in the direction of the management position it represents.

**Case in Point**—Take Pheoll Mfg. Co., Chicago fastener maker. When its president, Mason Phelps Sr., died, its net income slid from \$1 million plus in 1947 to \$204,000 in 1954. But the company has recovered. When its fiscal year ended last June 30, its net income had climbed back to more than \$1 million, compared with \$784,972 the year before.

The quick revival was largely the work of a new management team—headed by Mason Phelps Jr., who was only 28 when he became president. Many top executives at Pheoll are only in their thirties.

Most experts agree: Good management training is the key to solution of many personnel problems. With it you can attract promising young men. With it you can build a reservoir for executive replacement. With it you can move away from one-man management. With it you can find people who are capable and will accept responsibility. With it you can develop a team operation.

Without management training, you'll have trouble overcoming small business' greatest psychological fault, the know-it-all complex. Even for the small manufacturer, business is too complex for one head.

## Marketing

"Continued good hard selling took us out of the recession of 1954," says Dr. Arthur Burns, former chairman of the President's Council of Economic Advisers.

Small business does more marketing than any other segment of our economy. "Yet, many small businessmen are afraid of marketing research," says Arthur H. Motley, president and publisher of *Parade* and one of the nation's top sales personalities. "Such words as 'market potential,' 'selective analysis,' or 'probability sampling' scare them to death."

**Without Knowing** — The small businessman may be doing market research now and not recognize it as such. The manufacturer who interviews his salesmen on field conditions is doing it, as are the salesmen who report product preferences among customers, and the

controller who notes that profitability among lines varies.

The manufacturer often can get market research data cheaply. Practical help can be obtained from commonly available sources—business magazines, trade associations, government agencies, competitors, suppliers, customers. General Electric Co., for example, offers such aid to wholesalers and retailers of electronic products. Census Bureau figures are the basis of many business statistics. They are often broken down and made more meaningful for small companies by magazines, trade associations, and local chambers of commerce.

**Case in Point**—Original marketing research isn't always expensive. Wedemeyer Electronic Supply Co., Ann Arbor, Mich., saved selling expenses and improved selling efficiency by determining that a salesman could not economically travel over 100 miles a day.

A producer of special fasteners made a market study that led him to shift from direct salesmen to agents to improve his coverage and sales and cut selling costs. The expense of the study was less than \$500.

**4. Do you have plans to help you increase sales?**

Nothing in particular	44.9%
Will add new lines or products	27.6
Will advertise more extensively	3.2
Will open new branches or new accounts	0.0
Working on new designs and patents	12.6
Will feature better promotion and service	3.9
Will add new equipment	3.9
All other	3.9

**5. What's the source of your principal competition?**

Large companies	34.5%
Newcomers	14.8
Similar size concerns	50.7

**7. Do you plan to remain in business?**

Yes	97.6%
No	0.8
Don't know	1.6

**6. How do you view your future opportunities?**

Bright	34.7%
Good	53.8
So-so	6.9
Poor	4.6

**8. Would you sell out if you could get a fair price?**

Yes	10.9%
No	79.8
Perhaps	5.4
Don't know	3.9

Marketing research work is needed on whom to sell. For small metalworking firms, the answer is usually another manufacturer — and it'll probably be a large company. National Cash Register Co., Dayton, Ohio, puts it this way: "It's doubtful if the factory could be operated efficiently without the services supplied by small suppliers."

President Harlow H. Curtice of General Motors Corp. says: "The small supplier and the large manufacturer are partners. Each is dependent on the other." GM has 26,000 suppliers today, compared with 21,000 in 1955; 89 per cent of the 26,000 employ fewer than 500. In 1955, about half the GM sales dollar went to suppliers.

**Pointers**—"We want representatives that can give us the information we need when we want it," say purchasing officials of Westinghouse Electric Corp. GM (and other large firms) suggests that vendors come prepared with this information:

1. The vender's (or his representative's) name, address, and telephone number.

2. Date company was established.

3. Size of plant.
  4. Number of employees.
  5. Principal products.
  6. Location of plants.
  7. Description of production and transportation facilities.
  8. Approximate yearly sales volume.
  9. List of three representative customers.
  10. Financial and credit rating.
- Someone has said: "There's nothing wrong with small business' marketing that better information won't remedy."

### Research, Development

National research and development expenditures currently run between \$5 billion and \$6 billion annually. Yearly gains are at the rate of about 10 per cent—four times faster than the growth rate for the gross national product.

Yet, research and development by small business is about where it was with big business 20 years ago. Only 8.3 per cent of all companies employing 8 to 99 workers have organized research programs. Only 22.4 per cent of companies with 100 to 499 workers use organized research. Among larger

companies, 42.3 per cent of the 400 to 999 group do research; 60.2 per cent of the 1000 to 4999 employee organizations have programs; and 94.3 per cent of the firms hiring more than 5000 do organized research.

**Five Barriers** — Five barriers block greater use of research by small business, says Lyle M. Spencer, president of Science Research Associates, Chicago:

1. Few small business people realize the urgency of research and development. The number of research laboratories has grown from 1000 in 1930 to nearly 5000 today and the number of research scientists from 50,000 to a whopping 250,000.

2. The financial risk of research is too high and the results too uncertain to take the gamble. Even the most successful companies have a 50 per cent failure rate in new product development, and the average firm with well planned research has only one success out of three projects.

3. Research is too expensive, and the payoff takes too long. The average cost for a professional research man is about \$27,000 a year. A management consulting

firm advises against setting up your own research and development department unless you're prepared to take a minimum financial commitment of \$100,000 annually for at least five years before expecting the operation to pay off. The leadtime between the inception of an invention and its profitable marketing averages between five and seven years in a wide variety of industries, says Mr. Spencer.

4. Even if research is wanted, most small companies lack and

can't borrow the money to finance development.

5. Even if a research program could be financed, few small businessmen know how to plan, staff, or run such a program.

What can the small businessman do?

These approaches stand out: 1. He can resort to limited research by farming out carefully selected jobs to an outside organization. 2. He can participate in co-operative research through trade associations or other organizations. 3. He can take advantage of other (usually large) companies' research through licensing or similar arrangements.

**Farming Out—Diamond Expan-**

sion Bolt Co. Inc. needed a new product. The Garwood, N. J., maker of special fasteners contracted with Arthur B. Little Inc. to come up with one. It did—a small, one piece, hollow wall fastener. The project was so successful that the company felt justified in signing a contract with Little for \$2000 a month to continue product research.

**Co-operation—**The National Association of Aluminum Distributors has just completed a research project on the problems of crating and packaging aluminum sheets and tubing. At an average cost of \$300 per member, the project paid off in new crating and packaging methods which are expected to reduce

## HOW THE GOVERNMENT HELPS

### TECHNICAL SERVICES

#### Office of Technical Services, Department of Commerce . . .

- Assembles and distributes information resulting from government or government sponsored research which is not classified.
- Answers questions from small firms and big firms.
- Publishes: *U. S. Government Research Reports, Technical Reports Newsletter, Patent Abstract Series & Supplement, Developing & Selling New Products.*
- Supplies photostats or microfilm reproductions of Atomic Energy Commission reports which are not available in printed form or classified.
- Works with business groups on standardization problems.

#### Office of Distribution, Department of Commerce . . .

- Provides marketing information, including data on product development, use of materials, trade practices, operating and accounting systems, business locations, and sales training.
- Publishes reports on operating ratios and materials to aid wholesale, retail, and service firms in estimating their capital requirements.
- Makes special analyses of Census Bureau data to evaluate market potentials.
- Publishes: *Distribution Data Guide, Business Service Bulletins.*

#### Business & Defense Services Administration, Department of Commerce . . .

- Aids businesses with production problems. Large and small firms are represented on its Industry Advisory Committees which maintain continuous contact between business and government.
- Collects data on industry conditions and new product and technological developments.
- Advises other government agencies on their relations with business.
- Advises business on its relations with other government agencies.

#### Bureau of Foreign Commerce, Department of Commerce . . .

- Offers various services to firms doing business abroad.
- Evaluates specific opportunities for foreign business.

- Prepares detailed reports on foreign commerce.

- Maintains lists of business concerns abroad.

- Publishes: *Foreign Commerce Weekly.*

#### Office of Internal Trade Fairs, Department of Commerce . . .

- Tells how you may participate in foreign trade fairs.

#### National Bureau of Standards, Department of Commerce . . .

- Tests materials.
- Develops codes and specifications of physical standards.
- Gives small firms opportunity for co-operative research through NBS facilities.
- Publishes: *Journal of Research and Technical Newsletter.*

#### Office of Area Development, Department of Commerce . . .

- Assists groups in setting up programs of economic development.
- Serves as a clearing house for data on federal programs which aid community development.

#### Field Service Offices, Department of Commerce . . .

- Provide immediate and direct contact with business.
- Maintain field libraries with material of interest to businessmen.
- Offer help in bidding on government contracts, applying for financial aid and special tax benefits, and starting new businesses.
- Report on local business conditions.
- Publish: *Synopsis of U. S. Government Proposed Procurement, Sales & Contract Awards.* It lists invitations to bid, requests for quotations on negotiated contracts, set-asides for small firms, contract awards, and scheduled surplus property sales.

#### Small Business Administration . . .

- Counsels on finances, management, markets, new products, and government contracts. SBA has 15 regional and 25 branch offices.
- Lists items and services bought by the government (*U. S. Government Purchasing Directory*).
- Describes government specifications (*U. S. Government Specifications Directory*).

- Publishes abstracts of patents available to small firms, including privately owned or government owned inventions and opportunities opened up by successful prosecution of antitrust cases.

- Publishes: *Management Aids for Small Manufacturers, Technical Aids for Small Manufacturers, Small Marketers Aids, Small Business Management Series.*

#### Armed Services Technical Information Agency . . .

- Distributes technical reports to firms with military contracts.

#### Technical Information Service, Atomic Energy Commission . . .

- Issues access permits for classified documents.
- Provides classified and nonclassified engineering drawings for research and testing of civilian uses of atomic energy.
- Maintains 77 libraries of nonclassified atomic energy reports.
- Publishes: *Nuclear Science Abstracts.*

#### Business Service Centers, General Services Administration . . .

- Offer data on government procurement and surplus property disposal.

#### Department of Labor . . .

- Prepares special reports on manpower.
- Tests aptitude of workers.
- Recruits and places workers.

### TAX BENEFITS

1. Corporation income up to \$25,000 is exempted from the 22 per cent surtax.
2. Up to \$60,000 of retained income is exempt from the penalty tax for the unreasonable accumulation of surplus income. (The burden of proving that a firm has retained income in unreasonable amounts rests with the government.)
3. If more than 35 per cent of the gross estate or more than 50 per cent of the taxable estate consists of stock in one corporation, the stock may be redeemed to pay estate taxes of an owner (the distribution is not viewed as a dividend).
4. For two years, a corporation has the right to use losses incurred in one year to offset income earned in previous years.
5. Certain partnerships may be treated as corporations for tax purposes.

freight damages, save \$50 a day in labor, and \$100 a day in materials. Not counting lower freight damage, each member's investment will be repaid in two days.

**Licensing**—Western Electric Co. Inc. has given about 60 companies (many of them small) licenses to make transistors. Testifies one licensee, Texas Instruments Inc., Dallas: "For us the license led to a commercial breakthrough in silicon transistors." Classified as a small firm when it got the license in 1952, the company is now in the medium range and still growing.

Small business has some catching up to do in research and development. More than half of big company sales stem from products

unknown before World War II. Small business should be able to—but can't say the same.

## Government Relations

Despite occasional noises in Congress, small business is not unduly alarmed about its relations with the government.

**Improvement** — The amount of defense work being done by small business will probably surprise you: 19.8 per cent of the prime dollars awarded by Defense Department contracts in fiscal 1957 went to small business, compared with 19.6 per cent in fiscal 1956. Some 20 per cent of the dollar

value of all primes that are subcontracted goes to small business in the first tier of subcontracting.

About 30 per cent of Defense Department dollars could go to small business, but it's getting only about 52 per cent of that potential. It could get more by being more competitive, believes Joseph M. McKellar of McCulloch Motors Corp., Los Angeles. He recently returned to his company after a stint as director of small business policy for the Defense Department.

One of small business' most serious deficiencies is its failure to take full advantage of the help government offers (for high spots on what that is, see the accompanying exhibit).

## Production

Here's another surprise: Less than 5 per cent of all small businessmen are concerned about production, according to a survey made for the small business conference.

"We can make it; the job is to sell it," is a typical comment.

Most production problems boil down to personnel or research questions—how to manage production, or how to use research to lower costs and boost productivity.

## Advantages of Being Small

Small business has six major problems inherent in its size. But it also has a natural benefit: Flexibility. It is most readily apparent in:

**Delivery**—While a larger company may have hundreds of jobs in the works, each with a different delivery schedule, the small company has relatively few to schedule and can give more attention to them.

**Short Run Economy** — Small companies are in a better position to handle small orders than large firms geared for mass production. It puts them in a good position to handle emergency orders, or to become secondary sources of supply for high volume items.

**Production Control**—If it is necessary for the purchaser to step up, cut back, or cancel production of a vender's part, a phone call to the small shop gets almost immediate results because of the short

### FINANCIAL ASSISTANCE

#### SBA offers . . .

- Direct loans to firms unable to obtain private credit.
- Participation loans with banks and other lending institutions where it: 1. Advances part of the money. 2. Guarantees to purchase part of the loan from the lender at a later date.
- Loans at prevailing local rates. Interest can't exceed 6 per cent.
- Pool loans to corporations formed and capitalized by small firms to produce or acquire raw materials or supplies. Maximum amount of a loan: \$250,000 times the number of small firms in the pool.
- Loans to firms affected by floods, storms, and natural disasters.

#### Veterans' Administration . . .

- Guarantees business loans made by private lenders to eligible veterans of World War II or the Korean War.

#### Victory Loans . . .

- Government procurement agencies guarantee loans made by private lenders to their contractors to carry out the contract work.
- Maximum interest: 6 per cent.

#### Progress Payments . . .

- Procurement agencies give contractors payments based on percentage of the contract completed, or on a percentage of the total costs incurred to complete the contract.
- Financial need is not a factor in their availability.
- Partial payments are available, based on delivery of the contract items.

#### Defense Minerals Exploration Administration . . .

- Bears 50 to 75 per cent of the cost of exploring for strategic or critical minerals. Assistance is repaid if discovery and development result.

#### Treasury Department . . .

- Makes direct loans for purposes essential to defense.

### CONTRACT ASSISTANCE

#### Set-Asides . . .

- Defense Department, General Services Administration, Veterans' Administration, Departments of Interior, Commerce, Agriculture, and Post Office set aside a percentage of their contracts for small firms.

#### Subcontracting . . .

- Defense Department requires contractors to subcontract to small business the maximum amount which the contractor determines to be consistent with the efficient performance of the contract.
- For contracts of more than \$1 million, Defense Department urges the contractor to: 1. Publicize its willingness to subcontract to small firms. 2. Adopt procurement policies which give small firms as good a chance to get subcontracts as large firms. 3. Report to Defense on the success of its small business subcontracting efforts.

#### Bidding . . .

- Defense favors advertising for bids to negotiated contracts.
- Small firms are given preference on tie bids.
- Precise specifications, drawings, and other pertinent data are made available to all bidders.
- When a small firm bids low but is refused the contract on the basis of a pre-award survey, SBA can rule that the small firm must get the contract if it is competent.
- Special offices within government agencies which urge subcontracting to small firms are maintained by the Atomic Energy Commission, General Services Administration, and the International Cooperation Administration (as well as the Defense Department and the individual services).

#### Renegotiation . . .

- Up to \$1-million worth of business may be done with the government in any one year without being subject to renegotiation proceedings.
- Losses sustained on renegotiation business may be carried forward two years.

## A New Business ?

HOW do you go about starting a new business? What is the most important element?

In the production field, it's choice of product, says George V. Woodling, Cleveland patent attorney, who founded Flodar Corp. in 1945 with \$2500. Last year, it grossed \$670,000.

**"Superinvention"**—Invent a product similar to one that is established and in demand, but design it to avoid patent infringement, says Mr. Woodling. He calls the technique "superinvention."

It is a bread-and-butter practice among patent attorneys who spend hours searching patents for clients. In the process, they become familiar with the trial and error results of other inventors. They learn to avoid pitfalls.

**How It Works**—It requires careful, imaginative study of patents with the idea of finding a bypath which can lead to a patentable idea based on an established device.

It requires the services of a patent expert who has some technical knowledge and business experience.

**Checklist**—"Invent a device which meets a long-felt need," says Mr. Woodling. "Choose something that is readily consumed or wears out quickly and you have an established market. Make your product small so that it can be mass-produced on existing machinery, but be sure it is better than existing devices. Make is quickly interchangeable with similar devices made by competitors."

Flodar Corp. produces hydraulic fittings. Mr. Woodling realized that higher hydraulic pressures being used in industry would create a "blue chip" demand for fittings that would not leak or break.

**Barred by Patent**—Existing patents so thoroughly covered the conventional soft metal sleeve in hydraulic fittings that Mr. Woodling turned to hard tempered, alloy spring steel, something that had never been tried. The new product offered increased holding power and reduced tube vibration under high pressure. From the start, it has been easy to sell.

**Other Elements**—Flodar was set up as a simple corporation under Ohio law with 250 shares at \$10 each.

"A good attorney and a good accountant are vitally necessary to guide a new business through the maze of laws . . . to map growth . . . and advise on the plowing back of profits," Mr. Woodling says.

chain of command. In the large company, it may be a matter of days before the order clears all departments involved and reaches the production line. Time and money are lost.

**Paperwork** — A small company may operate on a single purchase order, while a large company may require many copies and separate instructions.

**Quality Control** — Because cancellation of a contract due to poor quality may seem a relatively greater loss to a small company than a large one, more attention is often paid to inspection procedures in the small shop.

**Design Control**—If it becomes necessary to alter design in the middle of a run, it is done easier in the small shop than the large because the work is easier to lo-

cate and less machinery is involved.

### Summary

Precision Piece Parts Inc., Mishawaka, Ind., is a typical small business. Despite its mere 50 employees, the maker of screw machine products bids for defense work. Its standing in its community is measured by the fact that it has a waiting list for openings in both its skilled worker ranks and its apprentice program.

W. R. Nace, president, ascribes his company's performance and standing to:

1. Plant efficiency. (All equipment is replaced within ten years on a regular replacement schedule.)

2. Specialty production. (60 per

cent is defense work; emphasis is on tough jobs requiring alloys and stainless steel.)

3. The personal touch. (Precision never intends to grow beyond its present size.)

4. A profit sharing plant. (It keeps the work force efficient and interested in seeing that business is good and backlogs substantial.)

Last year 327,000 small businesses were discontinued. But 381,000 new ones were started.

Says Commerce Secretary Sinclair Weeks: "Small business comprises the overwhelming majority of establishments, opens limitless opportunities for individual initiative, and is the seed corn which aerates the economy. It is just as essential to our scheme of things in this country as growth is in any phase of life."

# Technical Outlook

**LONG-LIVED ROOFS**—The Corhard Electrocast basic roof on Republic Steel's No. 22 open hearth (Cleveland) finally went down for rebuild after 555 heats and four shutdowns for repairs. C. W. Cravens, assistant district manager at Republic, told the Southern Ohio Section of the National Open Hearth Committee, AIME, that No. 22 will get a new Electrocast roof. Another was installed on No. 24 several weeks ago, and No. 15 is due for one in the middle of November. The breakeven point for the expensive roofs is about 356 heats without repair. A big incentive: 2 to 3 tons more production per hour (through higher firing rates).

**FAST SCRAP CHARGING—**Armco Steel Corp. revealed at the same meeting that it is giving the Calderon charging system a try at its Butler (Pa.) works. Scrap is brought onto the open hearth floor in a highside gondola and is transferred to a charging hopper by magnet. Under the hopper sit three charging pans (one to receive the charge; two for spillage). When a pan is full, a charging machine behind the hopper moves the pan directly forward into the furnace. The system eliminates the string of buggies which block one furnace when another is charging. It speeds up charging by at least 15 per cent.

**PLASTIC TOOLS**—A research report (available from American Society of Tool Engineers, Detroit) offers two methods of measuring shrinkage in plastics to be used for tools. The Purdue Research Foundation did the work under the auspices of the ASTE Research Fund.

**NEW APPROACH**—Small crystals which grow as delicate plates from the surface of stainless steel point up a way to study failures by stress corrosion cracking. They were described as "submicroscopic platelets of chromium oxide" by Dr. Earl A. Gulbransen, advisory

chemist at Westinghouse Research Laboratories, Pittsburgh. (He was speaking before the Second World Metallurgical Congress in Chicago last week.) The crystals form on strongly stressed stainless steel specimens which are exposed to corroding atmospheres containing traces of chloride. In practice, stress corrosion cracking affects stainless parts which are in contact with corrosive systems while under an internal or applied stress. It can result in complete failure. Dr. Gulbransen reported that it can be triggered by such mildly corrosive substances as steam or perspiration on parts having only internal stresses left in them during their manufacture. Pipes, turbine blades—even coffee urns and cooking vessels—can fail in this manner.

**GIANT HONE**—Large cylinder liners made at Cooper Bessemer Corp.'s Grove City, Pa., plant now get their final touch of precision on a honing machine that's 33½ ft high. The machine will process parts with 36 in. holes, 96 in. long. It was designed at Cooper Bessemer.

**GRAPHITE COATING**—Horizons Inc., Cleveland, has developed a method of putting a wear resistant, refractory carbide coating on machined graphite parts. Dr. Morris A. Steinberg, head of Horizons' metallurgy department, predicts a broad range of uses for it—from nuclear reactors to diecasting machine inserts.

**ORE IN THE L-D—** A new L-D process plant at Gusstahlwerk Witten in the Ruhr operates almost without scrap. A typical charge in the converter consists of 29 tons of cupola hot metal and 1 ton of iron ore. The blowing cycle is 19 to 22 minutes, tap-to-tap about 40 minutes. Simplified material handling and freedom from tramp elements are the big advantages of making steel this way.

Carbon and low alloy steel  
castings made in  
Dietert process shells  
have close tolerances  
and fine surfaces.  
It's a production operation  
at a Texas Foundry

Patterns mounted on metal plates and contoured dryers are used in the D process

## D Molds Make Precise Steel Castings

BOTH CASTING users and foundries can profit from the Dietert process for shell molding. It is termed "a valuable tool for product development" by William K. Merkel, manager of the shell molding division, Kincaid-Osburn Elec-

tric Steel Foundry Co. Inc., San Antonio, Tex. (His paper on the process won an award in the Third Product Development Contest of the Steel Founders' Society of America.)

**What It Is**—Harry W. Dietert,

chairman, Harry W. Dietert Co., Detroit, established the theory of the process. Conventional core-blowing machines are used. The mold is blown between the pattern and a contoured metal dryer or machined blow plate. The dryer

## D Process Helps Casting User

1. Machining costs are reduced. Some tolerances can be obtained as cast. Machining, when required, is held to a minimum. Finish of forgings (as much as  $\frac{1}{4}$  in.) converted to the D process has been reduced to  $1/32$  in.
2. Tolerances of 0.005 in. can be held on holes 1 in. in diameter. Over-all tolerances of 0.030 in. (0.015 in. to a side) can be held on castings weighing up to 12 lb.
3. Castings have a clean, satinlike finish when shipped.
4. Smoothness of D process molds allows full advantage to be taken of the fluidity of the molten metal. Sharp edges, thin metal sections, intricate shapes, and sharp detail can be cast easily. The engineer has great freedom of design in developing new cast parts.
5. There are no limitations on the material specifications that can be obtained.

## D Process Helps Foundry

1. The average corerom has the equipment needed to start production. A large outlay of cash for elaborate equipment that cannot be used for any other type of production is not required. A core oven with temperature control and a small hand muller meet the basic requirements. A coreblower without a mechanical draw cylinder can be used with a vibrating core drawing machine. Accurate draws are easily obtained by using a coreblower equipped with an automatic draw cylinder and vibrator.
2. The process is easily organized into a compact operation.
3. Mold surfaces are hard and do not rub off or erode from handling. Molds do not draw dampness and may be stored several weeks.
4. Customers are looking for precision steel castings with fine surfaces. The D process makes the casting self-selling.

plates. The plates are vented and rigged for use on coreblowers with a mechanical draw cylinder. The coreblower operates on 80 to 100 psi of air pressure.

**Sand Mixture**—A four screen sand with an AFS fineness of 125 is used. Mr. Merkel says both round and subangular grain sands have produced excellent results.

An oleoresinous binder prepared for the process by Archer-Daniels-Midland Co., Cleveland, is mixed with the sand along with silica flour, fly ash, and iron oxide in an ordinary core sand muller.

D process molds have a green strength of about 0.5 psi. They develop a dry tensile strength of about 250 psi after proper curing. Molds at Kincaid-Osburn are baked 2 to  $4\frac{1}{2}$  hours at  $425^{\circ}\text{F}$ . The molds weigh up to 32 lb. The baking cycle is closely controlled to prevent mold warpage, cracking, and other forms of distortion.

Whether the molds are blown into contoured dryers or onto machined plates depends on the shape of the pattern and the venting properties which can be obtained. Machined plates should not be used if they cause the mold walls to be too thick for the proper venting of the gases formed in pouring.

**Cores** — Insert cores are made from the same material and handled in the same way as the molds. The insert cores can also be made with the  $\text{CO}_2$  process. Kincaid-Osburn uses the same sand for its  $\text{CO}_2$  cores as it uses for the D

forms the back of the mold and provides the support it needs in the green state.

A big advantage, particularly in steel foundries, is that any alloy can be used. There is no difference between the surface or the accuracy of an alloy or carbon steel casting. About 85 per cent of the castings made at Kincaid-Osburn are low alloy steels of the chrome-moly types. Some have about 0.30 per cent carbon, others about 0.40 per cent carbon. Another 10 per cent are in the low carbon category, and the balance are high alloy types.

Patterns used at Kincaid-Osburn are machined to tolerances of 0.001 to 0.005 in. and mounted on metal

Standard corerom equipment is used to make precision molds

## D MOLDS . . .

process. CO<sub>2</sub> cores are used when D process cores would be impossible to make without the use of dryers.

Assembled molds are bolted to-

gether if their size and shape permit. Some molds which are blown into contoured dryers cannot be so assembled. They are cradled in loose, heaped sand, and weights are placed on top to prevent the mold from opening at the parting

line due to metal pressure.

Gate cores and runner cups are made of ordinary core sand and coated with a core wash. No washes are used on D process molds or cores, and no pastes are used on the mold parting surfaces.

**Casting Properties**—The high permeability of the molds virtually eliminates presence of gas pockets in the casting and contributes to the fine casting surface which is obtained. Only in a few cores is a contoured shell required for good venting. Most molds can be blown on flat plates.

The possibility of hot tears is greatly reduced because the mold collapsibility can be regulated. The sand mixture can be adjusted so that the mold will collapse at the correct interval following solidification to minimize warpage and flaking off.

Special handling of D process castings is required during heat treatment to eliminate oxidation (because of the close tolerances.) It is necessary to take all precautions to prevent warpage.

**Way to Benefits** — Mr. Merkel says Kincaid-Osburn's progress in the use of the process is due largely to the co-operation of its customers. They have realized that many of their tolerances were based on the capabilities of their machining equipment rather than the need of the part. The realization sparked the conversion of many machined parts and forgings to unmachined D process castings.

• An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

All dimensions shown on the clevis and safety clamp link are held by the D process. Both parts are made of low alloy steel

These casing scraper blades are made of a low alloy, chrome-moly steel with 0.40 per cent carbon. Parts were formerly made by another precision casting process. Costs were reduced about 75 per cent

# A CASE HISTORY

THIS CASTING is part of a tool used in the petroleum industry. It must withstand severe abuse and is subject to high stresses.

When made from hot-rolled round stock, ten machining operations were required.

**Specifications**—The part weighs 1.75 lb. Its surfaces must be smooth enough to allow jaws to slide freely over the tapered section even under extreme loads. Parts must be held within 0.015 in., and a thin metal section is required.

Smoothness of the radial grooves (see illustration) is essential to the operation of the part. The grooves were formed by boring with a 5/16-in. drill.

**Conversion**—Engineers of McMurray Oil Tool Specialties, Houston, and Kincaid-Osburn combined to convert this job to the D process. Labor was

reduced 60 per cent, end cost 20 per cent.

The core that forms the radial grooves was made by the CO<sub>2</sub> process. It met dimensional and surface requirements without the use of dryers.

The threads in the tapered end and the back angles were the only areas machined after conversion. The back angles were machined because casting them would greatly increase foundry and pattern costs, and machining was relatively inexpensive.

Strength requirements were met by a low alloy cast steel of the chrome-moly type (ASTM specification A148-55, Class 105-85). The casting is heat treated to a 35-40 Rockwell C hardness, oil quenched, and drawn. The part is subjected to a normal load on the back angle of the lower shoulder which creates a stress of about 12,000 psi.

The D process holds the tolerance required on the 10 in. dimensions. Setup and machining are eliminated

Expensive and time consuming machining of the dovetail on this part was eliminated by the D process

A rough forging moves across the transfer and into machining position on the first machine. After the first pin is finished, the part will be moved automatically through the other three lathes. Other parts wait at right

# Crankshaft Line with a New Look

Four lathes, with 60-hp spindle drives, handle forged steel cranks, one pin at a time. Advantages cited include quick tool change and faster production with carbides

CARBIDES have been used only sparingly in machining forged steel automobile crankshafts, but a breakthrough may be in the works.

**Example** — Pontiac Motor Div., General Motors Corp., will go to them on a new line.

The system grew out of an eight-year research effort by Carl Bintz, president and general manager, Wickes Corp.'s Machine Tool Div., Saginaw, Mich. The line has

four, single purpose lathes designed for carbides. They are tied together with an automated transfer and handling system. Each machine completes one of the four pin diameters on V-8 crankshafts.

**Flow** — All machine cycles are automatic. Each crankshaft moves from the first section of the automatic conveyor into position opposite the first lathe. A cross slide picks it up and carries it about 5 ft, placing it in the open chucks.

The lathe automatically clamps the work and brings the cutting tools into action.

Less than a minute later, the No. 1 pin of the shaft is completed. A second overhead slide picks up the shaft and carries it back to the transfer conveyor which moves the shaft to the next lathe.

Movements to the next three machining stations are identical, except a different pin is machined in each. Also, the chucking in each station differs from the others since it compensates for the position of the pin being turned.

**Tool Change Speeded** — Every station of the automated line can be operated automatically, manually, or independently. Using

Special carbide cutters use standard inserts to slash tool change time. The drawing shows how the cutters work—triangular inserts for forming the pin diameter and round inserts for the interrupted cut on the cheeks

standard carbide insert tools, tool change time has been cut to a matter of minutes. When one lathe is shut down for change, the others continue to run—drawing parts from the supply on the transfer conveyor.

When the newly tooled machine is restarted, the first part from it jumps any gaps that may be on the line, so succeeding lathes won't have to idle while the work catches up.

Since retooling is simplified and machine operations are flexible, Mr. Bintz points out that there is nothing to prevent the line from being used to process crankshafts of several different engines.

**Lathe Power**—Each lathe has a double-end drive. Spindles are powered by 60 hp, variable speed, direct current motors. Cutting speeds have been boosted to over 250 sfpm. The lines can turn out 50 crankshafts an hour.

**Cutters**—The insert-type cutters, developed by engineers at Wesson Co., Detroit, approach the work from front and rear cross slides. Two circular tips in the front tool are used for facing the cheeks. A triangular cutter centered in the front holder aids two triangular inserts in the rear cutter for plunge forming the pin diameter.

Feed on the plunge forming is about 0.010 in. per revolution across the 2 in. width. Tools for cheeking, an interrupted cut, feed

Over-all view of the line shows four machines, transfer line at right and machine control panels at far left. Individual control panels at the machines permit manual operation for setup and adjustment

at roughly 0.040 to 0.060 in. each turn of the spindle.

**Future?**—Mr. Bintz predicts that the multiple machine technique, designed to do pins on the forged steel cranks, will also help crack

the carbide barrier on the bearing diameter and on both pin and main line bearings of cast iron crankshafts. He foresees substantial economies on all jobs using this production technique.

## Lab Checks Castings

by Night

Treats Patients

by Day

# Industry Sends Work to Doctors

THE average small clinic can't afford a high voltage radiation facility for the treatment of cancer patients. But several enterprising medical men at Madison, Wis., have solved the problem by enlisting the support of local industry.

The doctors operating the clinic treat patients by day. Industrial work is checked by night. One day a week they solicit testing and inspecting business from foundries and research laboratories.

They point out that their 24-million volt betatron (Allis-Chalmers) is well suited for its dual role—although an industrial betatron

can't be used to treat patients.

**Setup** — The building has two floors. The betatron, a cobalt room, and a 275,000-volt source are on the first. The betatron can penetrate 10 in. of steel in less than 5 minutes.

**Schedule**—By day, medical patients go to the second floor which includes offices, examining rooms, and a laboratory. The medical entrance to the betatron and radiation rooms is separated from the industrial entrance.

At 7 p.m., an industrial radiography staff takes over. Medical collimators are removed (they concentrate the betatron beam for

narrow radiation), and material handling equipment takes its place.

Shipments of castings are stored in a 6 by 40 ft corridor adjacent to the betatron room.

Thin section work, which needs low voltage sources, is handled in the room which contains the 275,000-volt source. It also opens into the storage corridor. Eventually, the cobalt room will be used for industrial work when the betatron time is filled up.

**A Thought** — Companies with a need for high voltage radiography might do well to consider the merits offered by this example of medical-industrial co-operation.

▶ Arter Rotary Surface Grinders are scientifically designed to provide extremely smooth, remarkably accurate micro-plane surface finishes. The basic feature responsible for these close tolerance, superior finishes is the relation of the grinding wheel to the work. With Arter machines, the grinding is done on the peripheral or outer edge of the wheel while the work is held on a rotating magnetic chuck. This results in extremely fine, concentric finishes so necessary for most component parts used in industry today.

Multiple Stack ... Or Single Stack?

## Single Stack Annealing Gets the Nod

At Republic Steel's plant in Cleveland, single stack and multiple stack furnaces are used to anneal the same type of coil products. Results favor the single stack

By **HOWARD E. MILLER**  
Assistant Chief Metallurgist  
Republic Steel Corp.  
Cleveland

TODAY'S mill buyer of cold-rolled steel wants coils instead of cut sheets, better drawing quality, finer surface, and prompt delivery. Annealing practice has been a limiting factor in meeting his demands. It has taken big improve-

ments in annealing to keep pace.

Two approaches have been used to increase annealing production.

The first: Larger furnaces which process greater tonnages during one cycle. The idea has been used in the multiple stack

furnace. With eight stacks, you can build a 325-ton charge.

The second approach: A small charge with a fast furnace time. The single stack coil furnace can handle charges of 60 to 90 tons.

One Approach—Multiple stack

# Spotlight on Annealing

Excerpts from an international symposium on Annealing of Low Carbon Steel, sponsored by Case Institute of Technology and Lee Wilson Engineering Co. Inc. at Cleveland—Oct. 29-30

## ANNEALING CYCLES

A satisfactory product must be furnished the customer. First consideration must be given to the time and temperature necessary to relieve cold working strain. This is the minimum necessary for an annealed product.

Annealing of cold-rolled sheets below 1150° F is hazardous, especially with short soaking times. This temperature appears to be borderline for cold working strain relief and does not produce sufficient grain growth.

Relief of cold working strain appears to be almost instantaneous, and, evidently, the higher the temperature, the more suddenly relief occurs.

Effect of temperature on grain growth is almost a straight line function from 1150 to 1340° F (considering the same soaking time). Soaking time is important only as it affects grain growth.

Annealing Cycles for Commercial and Drawing Quality Rimmed Steels—Howard E. Miller, assistant chief metallurgist, Republic Steel Corp., Cleveland

## ECONOMICS

Fabricators of cold reduced, flat rolled steel products have steadily raised quality standards. Stamping plants have been asking for better surface finish, and some have gone from sheets to coils for ease in handling and reduction of scrap. Mills have been forced to produce steel with more "rubber" in it to keep abreast of modern product designs.

Some customers still believe that all a mill has to do to produce flat-rolled sheets or coils in drawing quality is to anneal a little longer—and charge extra. Every producer knows there is more to it than that. Steelmaking must be controlled from the start. Drawing quality is influenced by the amount and type of scrap charges. Skilled annealing techniques are wasted if the cold-reduced steel comes into the annealing department with defects annealing cannot overcome—

segregation, pipe, excessive grain growth, hot and cold mill ridges, and scratches that will cause stickers.

Today, a commercial quality sheet must take a light draw. Competition has forced many companies to put 10 per cent of their commercial quality tonnage through a drawing quality annealing cycle.

Styles in industrial design have led fabricators into deeper and deeper draws. An example is the wrap-around bumper. One manufacturer requires a steel held to 30,000-33,000 psi and elongation must be 38 per cent before failure. Fabricating this bumper involves complex bends up to 120 degrees. In addition, the steel must be free of surface defects, even stretcher strain marks, because of its bright chrome finish.

Fabricators want larger coils to help them cut scrap losses. The fact that can companies are beginning to do their own shearing from coils is forcing mills to make expensive changes in physical layouts of their electrolytic tin departments.

Mills reject sheets for imperfections that a customer might be glad to put up with when the market is tight. This creates a larger tonnage of secondary products, which has an adverse effect on mill profits.

Economics of Annealing in the U. S.—  
Lyle F. Gulley, vice president in charge of operations, Granite City Steel Co., Granite City, Ill.

## AGING

Boron, which is readily soluble in  $Fe_3C$  may promote the solubility of nitrogen. Perhaps here is the basis for the development of entirely new annealing cycles which can be used to produce higher quality deep-drawing steels. Controlled precipitation (quench aging) is probably one of the most important keys to development of steels which do not exhibit strain aging.

The discovery that the return of the yield point due to strain aging can be masked by residual stresses introduced during temper rolling may be the other valuable key to the problem of aging. It should be possible by careful control of the temper mill to introduce

## ANNEALING . . .

furnaces at Republic Steel Corp.'s 98-in. strip mill in Cleveland have three rows of horizontal radiant heating tubes at each end. They are parallel to the length of the furnace. The two outside rows have six tubes each, and the center row has five tubes. So each furnace has 34 tubes, or 17 tubes on each end.

The tubes are evenly spaced from the bottom of the furnace to about two-thirds the height of the charge area. (The ability to heat a charge depends on the amount of heat which can be concentrated close to its bottom.) The heat input of the eight stacks is about 18 million Btu per hour, or about 2.25 million Btu per stack.

Bases — Designed for ease of

maintenance, the high convection type bases are 72 in. in diameter. They are equipped with 15-hp fans mounted under the center of the base which are capable of delivering 8000 cu ft per minute at 8-in. static pressure. The coils are separated in the charge by convection plates which make it easier for heat to penetrate from the edges as well as the perimeter.

a specified minimum residual stress. If this minimum is greater than the potential increase in flow stress due to strain aging, then the material will be nonaging in service. At the same time, strain aging restricted by annealing practice may eliminate other deleterious effects of aging—increased hardness and reduced ductility.

Quench Aging, Strain Aging, Yield and Flow Phenomena—  
Eric R. Morgan, assistant director of research,  
Jones & Laughlin Steel Corp., Pittsburgh

## BRITISH PRACTICE

Stickers can arise from three sources: Reel tension, furnace temperatures, and surface finish of the reducing rolls. Optimum surface finish on the last stand rolls is 50 microinches, achieved through shotblasting.

The Abbey Works uses byproduct nitrogen from its oxygen plant for annealing in a 95.5 N, 3.5 H atmosphere. Its multiple stack furnaces are fired by open flame. Gases exhaust to a stack in which a valve provides back pressure to maintain furnace atmosphere at zero pressure. Inner covers are made of 25 Cr, 12 Ni alloy. They have been in use for five years and look good for another five.

Is it too imaginative to predict that in the not too distant future we will be using small atomic reactors to heat our annealing gases? We must realize that the continuous annealing line is a mixed blessing. Because it produces a stiffer strip, the customer can use a thinner product, which with optimum reduction on the cold mill means a thinner band required from the hot mill, and that in turn means a smaller hot mill yield. When we are striving to increase yields, such a turn poses problems.

Annealing of Cold-Reduced Sheets and Coils in Europe—  
Harry H. Ascough, mills superintendent,  
Steel Co. of Wales Ltd., Port Talbot, Wales

## MILL PRACTICE

The microstructure of low carbon, hot rolled strip can be varied by proper selection of coiling and finishing temperatures. A uniform equiaxed grain structure may be obtained by doing all hot rolling while the steel is in the austenite condition. An abnormal grain structure, either coarse or deformed, may result when the finishing temperature is below the upper critical limit. The coarse grain structure results when the coiling temperature is above 1300°F; the deformed grain structure results when the temperature is well below 1300°F. A high coiling temperature leads to the formation of large, irregular cementite particles and

a low coiling temperature tends to produce finer, more uniformly dispersed cementite particles.

Scale is removed from hot-rolled strip by acid attacking the decomposed ferrous phase. The outer layers of  $\text{Fe}_2\text{O}_3$  and  $\text{Fe}_3\text{O}_4$ , which are only slightly soluble in acid, fall off once the underlying ferrous phase is dissolved. The rate of dissolution of the ferrous phase depends on the size and number of iron particles, which in turn depend on the rate at which the scale is cooled from above the eutectoid temperature down to room temperature. The iron particles which may be formed in the ferrous phase by proper cooling will be oxidized to magnetite or even ferric oxide if the scale is allowed to cool in the presence of air. This will reduce the ferrous phase pickling rate.

Effect of Hot Working and Cleaning Factors on the Final Characteristics of Annealed, Cold-Rolled Steel—  
Ralph D. Hindson, assistant chief metallurgist,  
Steel Co. of Canada Ltd., Hamilton, Ont.

## PREPARED ATMOSPHERES

By far the largest percentage of coiled strip is still annealed in deoxidizing atmosphere. However, desire on the part of the producers for a superior product, and demand of the trade for better quality prompted the need for an annealing atmosphere that would eliminate or alleviate the effect of prepared gases on steel surface finishes.

The best prepared atmosphere would be a dry  $\text{H}_2\text{N}_2$  mixture. Hydrogen-nitrogen atmosphere produces a bright plate, low in pickle lag and reasonably satisfactory in edge-center-edge corrosion resistance.

Generation and Use of Prepared Atmospheres in the Annealing of Low Carbon Steel Strip—  
George J. Campbell, assistant fuel engineer,  
Bethlehem Steel Co., Sparrows Point, Md.

## HARDNESS

Manipulating process variables produces only slight hardness changes in continuously annealed black plate and tin plate. Increasing annealing temperature from 1200 to 1300°F, increasing cooling time in the 950 to 700°F range from 10 to 45 seconds, and decreasing temper mill extension from 1 to 0.5 per cent caused only slight softening.

Studies of various carbon (0.10 to 0.20), manganese (0.47 to 0.80), and nitrogen (0.002 to 0.010) contents showed that nitrogen had by far the greatest effect in increasing the strength and hardness of continuously annealed tin plate.

Effect of Variations in Annealing Cycle and Composition on the Mechanical Properties of Continuously Annealed Tin Plate—  
P. W. Marshall, assistant director,  
Applied Research Laboratory, U. S. Steel Corp., Monroeville, Pa.

The normal furnace time for a full charge is 48 to 52 hours at about 1280°F (minimum). Furnace tube temperature is carried at between 1400 and 1425°F. On a drawing quality charge of coiled steel, the furnaces handle 5.8 to 6 average tons per hour for the total charge, or 0.72 to 0.75 tons per hour per stack.

**Loading**—It is difficult to con-

sistently load the furnaces to best advantage. Bases should be loaded evenly, and coils should have an even wall thickness, to obtain maximum tons per hour and a product of consistent quality.

Having the required size and number of coils necessary for a charge is not always possible; in most the load varies from base to base, which presents a problem in

heating. To obtain complete annealing, the furnace must be fired to the advantage of the heavier coils and the heavier charged bases, with a resulting loss of tons per hour.

**Time Losses**—The furnaces have an uneven heating rate within each coil as well as within each stack. Since a large percentage of heat transfer is by radiation, areas

# Gulf Oil Corporation announces

Gulfway meets machine tool manufacturers' specifications as a way lubricant and hydraulic medium for grinders, milling machines, planers and boring machines, lathes and other machine tools.

# GULFWAY

## new three-purpose oil for smoother operation of machine tools

### AS A WAY LUBRICANT

Gulfway forms an exceptionally slippery and tenacious film on slides and ways. Its inherent high oiliness is bolstered by a tackiness agent that keeps it sticking to metal. Gulfway will not squeeze out when the table is at rest for long periods. It contains a special low-shear additive that maintains lubricity when clearances are tight or loads are excessive. Gulfway eliminates "stick-slip" chattering that shortens tool life and causes excessive wear of the ways.

### AS A HYDRAULIC FLUID

Gulfway will not plug hydraulic lines and controls, or cause pumps to work erratically. It flows freely at all times, even after long periods of dormancy—needs no run-in or warm up and places no strain on pump or motor.

### AS A BEARING AND GEAR OIL

Gulfway's characteristic oiliness and high load-bearing capacity make it an ideal lubricant for machine tool gears and bearings. Its long service stability provides an extra margin of economy.

Gulfway is available in two different viscosities. Why not make this new oil prove itself in one or more of *your* machines? Contact your nearest Gulf office, or write to:

# Automatically sprayed-on drawing compounds cut metal-forming costs

NEW DEVILBISS METHOD SAVES COMPOUND, COATS EVERY PART EXACTLY ALIKE, IS FULLY AUTOMATIC

**Split-second timing.** DeVilbiss WDB automatic guns spray exact amounts of drawing compound evenly over specific areas of die, as it opens and closes. To synchronize spray with press cycle, cam-actuated air valve is worked off the ram. In other instances, a solenoid air valve is actuated by chain-drive timer, operating off gear wheel.

Now you can cut stamping costs, increase production rates, get uniform application of drawing compound in your production of stamped or formed metals. DeVilbiss spray method and versatile spray guns eliminate wasteful swabbing, rolling, or dripping lubricants—save you time and money!

**DeVilbiss WDB Gun** is designed and built specially for applying die lubricants. It is compact, durable; sprays all types of compounds—from the lightest oil to the thickest creamy or foamed materials. Spray pattern is completely

adjustable, from a fine round shape for narrow stock, to a broad fan for wide surfaces. The gun is built to maintain precise, constant rate of application; is easy to install, and offers low maintenance.

For full details, see your nearest supplier today; or write us direct. *The DeVilbiss Company, Toledo 1, Ohio.*

DEVILBISS HELPS YOU GET THE MOST FROM THE SPRAY METHOD

## ANNEALING . . .

farthest from the tubes have the slowest heating rate. To thoroughly anneal the entire product, it is necessary to lengthen the time cycle to compensate for the slowest rate.

The time necessary to cool the charge is also affected by the variation in base charge weight. Since the lightweight base will be thoroughly cold while the heavier charge will still be too hot to uncover, time is lost in delivering some of the product to the temper mills.

With today's close scheduling, such delays must be held to a minimum.

The combined effect of differences in coil sizes and the variation of heat transfer results in a range of Rockwell hardness and grain size in the material. Rockwell hardness will range from B-32 to B-48 in automotive drawing quality steels annealed at the best temperature and cycle. A longer cycle does not change the range to any great degree (it might drop the upper limit slightly). From a heating and quality standpoint, the furnaces are difficult to operate with close enough control to give a consistent product.

**Other Approach** — Republic's single stack furnaces are of the high convection, radiant tube type. Ten vertical tubes spaced evenly around the periphery of the furnace have a heat input of 5 million Btu. The tubes, extending about two-thirds of the height of the furnace, concentrate the heat at the bottom of the charge. The arrangement permits heat inputs and concentration that bring the charge to temperature faster than the multiple stack can. Increased productivity per furnace results.

The bases are a high convection, portable type designed for ease of maintenance. They are equipped with 15-hp fans capable of delivering 8000 cu ft of air per minute at 8 in. static pressure. Double wall inner covers are being used. The rapid, even circulation between the walls aids in shortening furnace time and increasing output per hour.

**The Charge**—In comparison with the multiple stack furnace, loading is simple. With a charge of only two or three coils, it is rela-

## ANNEALING . . .

tively easy to select the coils for each charge.

It is easy to take advantage of a light charge for a fast heating rate; on heavy or full weight charges, compensation can be made in cycle time to assure a fully annealed product. The furnaces have a capacity of 30 to 40 tons, or an average of 1.1 tons per hour on deep drawing automotive body sheets.

**Metallurgical Advantages** — In comparing furnace performance, Republic has found that the single stack offers greater uniformity in hardness and grain structure. Since the ten tubes are evenly spaced around the furnace, fast, even heating is possible. The greater heat input, 5 million Btu per stack, affects the speed of the heat by convection and radiation, shortening the complete annealing cycle.

Soaking time need be only 8 to 12 hours to insure complete heating throughout the coil. The faster heating cycle has resulted in a cleaner product. The temperature range of 700 to 950° F is a critical one for carbon deposit and breakdown of the deoxidizing gas in the charge. The fast heating cycle helps to avoid carbon deposit because there is less time in the critical temperature range. The furnaces have less temperature lag from coil to coil in the charge. To some extent they avoid the breakdown of the gas.

**Handling** — Republic finds the single stack furnaces more maneuverable than the multiple stack in operation and maintenance. With the multiple stack, loss of one base or one furnace for repairs means the loss of eight stacks.

With the single stack, each stack can be treated as a separate charge, and the annealing temperature and cycle can be adjusted for best practice. The product is of more even quality than that from the multiple stack furnace.

With proper operation, good quality work can be done in either type furnace. Republic uses both. But factors of operation, maintenance, and quality favor the single stack.

**MACHINING PERFECTION** always starts with the right steel

*Pick exactly the right steel for any job  
from J & L's complete cold finished line*

***"Manufacturer saves three ways  
with J & L 1113 Bessemer steel"***

This friction shaft part for a textile machine was converted to J&L "1113" Bessemer steel with these results:

- Time cycle reduced 20%
- Surface finish improved 20%
- Tool life increased 100%

Due to these savings, manufacturer is now using J&L "1113" steels for other applications. You can get similar savings in cutting speeds and tool life. Get facts from your distributor or write to Jones & Laughlin, 3 Gateway Center, Pittsburgh 30, Pennsylvania.

**Jones & Laughlin**  
... a great name in steel

These 2-in. steel cylinders are threaded for eyebolts. A drop of Eastman 910 adhesive holds 200 lb in 5 minutes; in 48 hours, it holds 15,000 lb. Demonstration setup is at left

# New Adhesive Holds 5000 psi

Joining assemblies with adhesives is said to be easier and faster with this material. This article describes the material and suggests some areas for its application

**RESEARCHERS** at Tennessee Eastman Co., Kingsport, Tenn., a division of Eastman Kodak Co., have come up with an adhesive which is said to be unusually strong, versatile, and quick-setting.

The photo above illustrates its properties: A single drop on a surface 2 in. in diameter holds 200 lb in 5 minutes, 5000 lb in 30 minutes, 15,000 lb in 48 hours. It requires no heat, pressure, or solvents. (Ultimate steel-to-steel tensile strength: About 5000 psi in 48 hours.)

Glass-to-glass bonds are unbreakable in 5 to 15 seconds, steel to steel in 20 seconds, wood to wood in 5 minutes.

**Properties**—Called Eastman 910 (a cyanoacrylate), the adhesive bonds unlike materials which don't respond to conventional cements, and firmly holds small joints such as those in miniature assemblies.

It works well on many plastics.

**Preparation** — Bonding surfaces must be thoroughly cleaned and dried. Only surface dirt needs to be removed. A toluene-acetone mixture is recommended for metal surfaces.

The adhesive is applied to one side of the joint. When a thin film covers the whole surface, the other half is pressed firmly in place.

**Quantity**—Eastman says that 1 lb will cover 100 sq ft on a smooth, nonporous surface. The adhesive sets within a few seconds after the parts have been pressed together. Most bonds are sufficiently cured within an hour to withstand rough handling.

**Temperature**—Short exposure to 212° F doesn't materially affect tensile strength; prolonged exposure breaks it down.

Eastman 910 resists solvents well. A 24-hour immersion in alcohol, benzene, or acetone doesn't affect it. Weak alkalies or acids cut tensile strength slightly.

**Handling**—The firm also points out that the adhesive reacts quickly with alkaline substances. It must be kept in closed containers. Shelf life is six months to one year.

It isn't harmful to skin although the dried film is hard to remove.

Photomicrograph of etched silicon-iron shows lined up cubic crystals. Their orientation provides good magnetic paths along the length and width of a sheet

# Magnetic Steel Is Doubly Oriented

A major advance in materials, it can be easily magnetized in four directions. It means that large transformer laminations can be stamped in one piece instead of four

A NEW magnetic steel promises to improve the performance of electrical apparatus and simplify its construction.

Originated by scientists at the Vacuumschmelze of Hanau, Germany, and developed by Westinghouse Electric Corp., the material, called Cubex, is a "doubly or cube-oriented" silicon-iron. It is expected to be used in the magnetic cores of transformers, motors, and other electrical devices.

**Distinctive Feature**—The silicon-iron can be easily magnetized in four directions. Conventional magnetic steel is singly oriented. It can be easily magnetized in two directions only—along the direction in which the steel was rolled.

The atoms of iron form crystals in the shapes of cubes. The direction along any edge of the cube represents an easy path for mag-

netization; directions across any face of the cube, or through it, represent difficult paths. In Cubex steel, the cubic crystals are lined up, or oriented, providing good magnetic paths along the length and width of the sheet.

**Due to Processing**—The material has about the same composition as standard magnetic steel—3 per cent silicon and 97 per cent iron. The big difference is the way it is handled during its processing from the rough sheet to the final product.

Westinghouse scientists believe that the formation of cube orientation depends on a new mechanism of crystal growth and on carefully controlled structure during metallurgical processing. Under best conditions, test strips have approached 100 per cent orientation of the cubic crystals; the easy

magnetization directions of the cubes were all within 20 degrees of the rolling direction or 90 degrees from it.

**Still in Laboratory**—A considerable amount of research and development still is required before the new material will be commercially available in useful sizes, says Westinghouse. Experiments have shown that the alloy can be made in thicknesses being used in 60-cycle electrical equipment, and small amounts of thicknesses useful for high frequency applications have been made.

**Significance**—The chief aim in building magnetic cores is to provide easy magnetic paths. In building rectangular cores for large transformers with singly oriented material, straight strips of metal laid at right angles in a rectangular shape must be used.

With doubly oriented silicon-iron, L, E, U-shaped, or rectangular stampings could be punched from a sheet of steel in one operation. This would simplify construction of the core, besides giving an improved magnetic path.

# Cadmium Plating: How To Avoid Embrittlement

- 1. Maintain current density in cyanide bath at 60 asf, or higher. The plate is more porous; hydrogen will evolve during a relief bake.**
- 2. Make a standard cyanide bath nonembrittling. An aircraft manufacturer has done this by adding nitrate ions to suppress hydrogen formation.**
- 3. Try vacuum metallizing. There is no possibility that the steel can become charged with hydrogen. Corrosion resistance compares to that of electroplates.**

Cadmium plates provide good protection for heat treatable, high strength steels like SAE 4340. Cyanide solutions are best to work from, but they often embrittle the parts

HYDROGEN embrittlement resulting from plating parts in cyanide cadmium baths can usually be relieved by a postplating bake. The problem is to assure satisfactory recovery every time. Another and better solution is to plate in a nonembrittling bath.

Lockheed Aircraft Corp., Burbank, Calif., has developed three techniques for reducing or eliminating hydrogen embrittlement. Reported at the SAE National Aeronautic Meeting in Los Angeles, they include: A controlled procedure for a standard cyanide bath, a modified nonembrittling cyanide bath, and vacuum metallizing.

**Cyanide Baths**—There is a direct relationship between the current density used in a cyanide bath and the residual embrittlement a part retains after a relief bake. In parts plated to a 1 mil thickness

with current densities of 10 to 50 amperes per square foot (asf), residual embrittlement is more severe than when electroplating is done at 60 to 80 asf.

The best explanation: At higher current densities, the plate has lower density. Assuming that nonporous cadmium is a barrier against diffusion of hydrogen, and the porosity increases as density decreases, an embrittlement relief treatment (where absorbed hydrogen is evolved) is more effective when cadmium density is lower.

All high strength SAE 4340 steel, heat treated to 260,000 psi tensile strength or higher, must be plated at a current density above 60 asf at Lockheed.

**Nonembrittling Baths**—Cadmium fluoborate is nonembrittling, but it has poor throwing power. Postbaking of parts plated in cadmium fluoborate makes them brittle. Or-

ganic electrolyte baths also have limited throwing power and do not have the conductivity of aqueous baths.

Since the cyanide bath is superior in all respects except embrittlement, Lockheed research engineers set out to make it nonembrittling. They added nitrate ions to suppress hydrogen formation and a trace of an organic agent to maintain the throwing power and covering properties.

**Results from Bath**—Tests conducted for a year in a 200-gallon pilot plant tank indicate that the bath is not much more difficult to maintain than standard cadmium cyanide plating solution. Bend, reduction of area, and notch tensile tests indicate that SAE 4340 steel, heat treated to 260,000-280,000 psi tensile, can be plated in the modified cyanide bath without apparent embrittlement.

A new procedure for cleaning parts before plating has been developed. It yields stress rupture results equivalent to those of uncleaned parts. Procedure: 1. Fine vapor honing to remove scale and rust. 2. Anodic cleaning at 100 asf for 5 minutes in a commercial caustic cleaner, followed by water rinse. 3. Electrohonoring at 100 asf for 15 minutes in a sulfuric-phosphoric acid bath, followed by water rinse.

The procedure reduces embrittlement to a minimum and is recommended for use with all types of ferrous metal plating where hydrogen embrittlement is a problem.

**Metallizing**—Another nonembrittling method tested by Lockheed for coating high strength steel parts with cadmium is vacuum metallizing. There is no possibility that the steel can become charged with hydrogen.

Parts are blasted with light grit (180 mesh or finer) before racking and placing in the vacuum chamber. The chamber is pumped to 0.5 micron pressure. A coating 0.0005 in. thick can be put on a part in 15 to 35 minutes, depending on the operator's skill in distributing crucibles in the chamber and regulating the rate of vaporization.

**Adhesion**—When the base metal is reasonably clean, adhesion is at least equivalent to that of electroplated specimens. Surfaces con-

### CADMIUM PLATING . . .

taminated with dirt and oil can cause failure.

Coatings deposited on polished surfaces of 302 stainless, 2024 aluminum alloy, chromium plate, and low alloy steel showed poor adhesion. Results indicate that a purely mechanical bond is obtained with blasted surfaces.

Electroplated cadmium coatings normally can be blown or brushed off chromium plated areas of parts in production, but chromium plated areas of parts to be vacuum metallized must be masked; considerable effort is required to remove the cadmium from the chromium plate.

**Coating Thickness**—A uniform coating thickness is easily obtained by an experienced operator. The throwing power is better than it is in plating tanks and does not tend to build up as much on projections.

The vacuum deposited film is more porous than electroplated coatings.

**Corrosion Resistance**—Generally, vacuum deposited cadmium coatings offer corrosion protection comparable to that of electroplated coatings. Metallized films ordinarily develop a white efflorescence in salt spray tests, but no rusting occurs in the substrate.

Many aircraft production parts processed by vacuum metallizing have been subjected to salt spray tests with uniformly satisfactory results. The variety of configurations used in the tests is considered to be a good cross section of the conditions encountered in manufacturing.

**Postprocessing**—Vacuum metallized films will accept chemical treatments and organic coatings in the same way and with the same benefits as electroplated films.

Heavy vacuum deposited cadmium films do not appear as bright as electroplated coatings. A dull matte finish (gray-white) is obtained. It's usually accompanied by a light superficial dust. Light buffing easily produces a bright finish but does not enhance the protective value of the coating.

Leaks in the vacuum chamber cause deposits which are dark to black, but salt spray tests indicate there is no loss in corrosion resistance.

# New Southern Star...

When you are on the market for billets, bars or slabs of aircraft and commercial grade alloy, stainless or forging quality carbon steels, you can't do better than order from recently revitalized Green River Steel Corporation. Born in 1953 on the banks of the Ohio River at Owensboro, Kentucky, Green River is not only the newest electric steel producer in America, it is the foremost company in its classification south of the Mason-Dixon line. Now, backed up by Jessop, its new parent organization, it offers quality and service never possible before. Ingots poured from Green River's spanning new 60-ton arc-type furnaces will continue to be processed under the exclusive Dornin patents which make Macro-clean steels of unmatched forging qualities and grain structure. But now, Green River is reaping the benefits of the years-ahead quality control methods and the excellent marketing organization of its parent Jessop. Today, more than ever before, you'll find it pays to do business with Green River—the steel industry's new Southern Star!

These Jessop district offices and representatives can now service you with Green River Products

# GREEN RIVER STEEL

CORPORATION • OWENSBORO, KENTUCKY

A SUBSIDIARY OF JESSOP STEEL COMPANY

1. Operator feeds flat blanks to the first of three presses in the roof line. With the exception of this operation (loading), all work on this line can be done by one operator at a central control console

# Chrysler Boosts Stamping Capacity

5. This turnover fixture on the quarter panel line catches the inverted panel from the Sahlin hand and rotates panel 180 degrees. As the panel slides down the incline, the far end hits a pipe that holds it. The panel indexes 90 degrees

6. These line dies do a series of trim and spunk operations on quarter panels for 1958 model Plymouths

2. A Sahlin mechanical hand picks a roof panel from the first press, a draw operation, and flips it up and away from the dies. As the roof is swung up, this table rises to catch the inverted roof and start it down the line

3. Drawn panel loads into the trim dies as its trimmed predecessor is pulled onto a belt conveyor that takes it to the roof rack

4. Finished roof panels are loaded into waiting racks. Note rails on the floor that will guide loaded racks out of the work area

Already in partial production,  
this new plant will house 260 presses.  
It will turn out 300 different  
stampings for all  
the corporation's automotive lines

CHRYSLER management is betting heavily that its 1957 sales boom will continue.  
As part of the wager, the corporation has put up an \$85-million dollar stamping plant at Twinsburg, Ohio, that may eventually add as much as 40 per cent to the firm's stamping capacity.  
**Progress Report**—About 65 per cent of the 1.7 million sq-ft building is in operation (22 of 28 major press lines are working). The balance is still under construction. When it's finished, some 3500 men will be processing 300 different kinds of body stampings.

**Flow**—All raw material is received on the east side of the building. Production flows in a straight line to shipping on the opposite side of the building.  
W. T. Hanlon, plant manager, expects all incoming material to be coils within a few years. In fact, the present stock preparation department could do the job. The department is next to receiving. Its slitters, shears, and blanking presses turn out press stock in the form of coiled strip, blanks, and sheets.  
Twenty-eight presses (across from stock preparation) head up

the major stamping lines. Karl Horvath, manufacturing manager, is particularly proud of the exit ends of the line. "One problem with stamping shops," he explains, "is that while many lines have a high degree of automation, product flow breaks down when it comes to getting finished pieces away from the line."  
One solution to this problem in Twinsburg: Angle irons have been bolted to the floor to form tracks. As soon as a wheeled rack is loaded, a hydraulic cylinder will push it out of the way and bring in an empty one.

# NEED HELP WITH

# Sheet Handling Problems?

Dexter 9000# H.D. Feeder runs at speeds up to 9000 sheets of tin plate per hour. Used primarily in most major metal decorating plants.

Dexter Plate Feeder handles metal plates up to  $\frac{3}{16}$ " thick and a maximum size of 4-by-12 feet. Used in many plants for feeding descaling equipment.

## CHECK WITH DEXTER

Dexter's been designing and building sheet handling equipment for over 75 years...*sheet feeders* for metal decorating presses, scroll shears, punch presses, coaters, slitters...*pack turnovers* for speeding up two operation processes...*oven strippers* and *pillers*...*cardboard* and *corrugated board feeders* for presses and packaging lines...*paper feeders* for printing presses, varnishers and folding machines. For almost any sheet feeding problem Dexter has the answer...with its wide range of equipment.

Dexter Feeders are available in over a hundred sizes, speeds and load capacities to suit individual machine or process requirements. Sheet sizes range from 14 x 14" to four by twelve feet...sheet thickness from .006" to  $\frac{3}{16}$ "

or more...load capacities from 6,000 to 30,000 pounds...and speeds from 600 to 9000 per hour!

Thousands of Dexter sheet handling machines are in use today in container plants, electrical equipment factories, appliance manufacturing plants, in tin plating lines, printing and binding companies, and in a wide variety of other industries...speeding up production efficiently and economically.

If you need help with your sheet feeding problems—check with Dexter. Their combination of engineering experience and equipment flexibility may be the solution for increasing your productivity.

Write or call for complete details.

**DEXTER**  
**FOLDER COMPANY**  
DIVISION OF MIEHLE-GOSS-DEXTER, INC.

General Offices: 219 East 44th Street, New York 17, New York

## Towing Tractor Can Pull 100 Tons on Level Surfaces

This industrial towing tractor comes in models with gasoline, diesel, or LP gas engines. The engines develop 74 brake horsepower and torque of 170 ft lb at 1200 rpm.

The tractors are 101 in. long, 57½ in. high, and 66 in. wide. Underclearance at the center is 9 in.

The welded steel frame is reinforced and gusseted to assure complete alignment of the drive train.

The front bumper is made of heavy steel plate to protect the tractor and front wheels when the tractor is used as a pusher unit. Gears are heat treated and carburized. *Write:* Allis-Chalmers Mfg. Co., Milwaukee, Wis. *Phone:* Spring 4-3600

## Machine Simplifies Handling of Rod and Wire Coils

This hydraulic loading and stripping machine can load or unload a complete stack of coils in a single operation. Only one operator is needed to handle rod or wire.

The stack to be loaded is placed in the trough of the loading machine by a standard ram truck or a C hook.

The loading machine upends the coils to a nearly vertical position over the coil pit which holds the empty spider.

Hydraulic cylinders position the spider and elevate it through the stack in perfect position for crane handling.

Unloading is done in reverse. *Write:* Lee Wilson Engineering Co. Inc., 20005 W. Lake Rd., Cleveland 16, Ohio. *Phone:* Edison 1-6600

## Surface Grinder Has Two Work Spindles

The Plano surface grinder can handle work up to 80 in. wide. Distance from the grinding wheels to the table top is 60 in.

Hydraulic power provides traversing and jump feeds in increments from ½ to 4 in. Cross feeds in increments of 0.001 or less also can be set at the pendant.

Table feeds range from 5 to 100 fpm; cross slide feeds are from 5 to 30 fpm.

The vertical head swivels up to 50 degrees each way. This enables the machine to grind V and flat ways, dovetails, shoulders, edges, radiuses, and contours in one setup.

Twenty motors are used on the machine to enable

the operator to control all movements from a single station. *Write:* Mattison Machine Works, Rockford, Ill. *Phone:* 2-5521

## Welding Positioner

Model GE250 has a capacity of 25,000 lb with the center of gravity 12 in. above the table and 12 in. offcenter.

A four-speed transmission provides speeds of 0.76 to 0.11 rpm for rapid positioning, 0.38 to 0.05 rpm for large weldments and average welding speeds, 0.26 to 0.034 rpm for larger weldments and slower welding speeds, and 0.19 to 0.025 rpm for the largest weldments and slowest speeds.

The cross-sectional column of the base is 47 x 78 in. All elevator mechanisms, including the columns, are inside the chassis. Nothing extends above the top of the chassis to obstruct the turning of large weldments. Write: Aronson Machine Co., Arcade, N. Y.

## Press Feeder

This automatic unit feeds heavy flat strip (of a thickness beyond the capacity of conventional roll feeds and straighteners) to presses.

The feeder can be adapted to single operation or progressive dies.

Strip stock is rolled manually into a preload station and automatically lowered to a feeding station by arms controlled by air cylinders. The strip is fed into the press by a reciprocating mechanism which has mechanical grippers. The stroke is adjustable.

Electric controls of the feeder can be tied into the press cycle to provide a fully automatic feeder

arrangement. Write: Press Automation Systems Inc., 25418 Ryan Rd., Centerline, Mich. Phone: Jefferson 9-7750

## Bender Loads Easily

Vertical design of this bender facilitates material handling in and out of the machine. Two pivoting heads form two 90-degree bends simultaneously in a steel radiator support channel.

When the start button is pressed, the bending forms, mounted on pivoting heads, move in to clamp the workpiece and begin the bends. Wiper shoes move vertically to form the channel around the bending forms. When the bends have been completed, the heads retract and the finished part is ejected automatically.

Galling is virtually eliminated because the wiper shoes are supported in bronze ways which permit the shoes to move with the workpiece during the bending operation.

Power is supplied by a 20-hp motor. Cushion-type cylinders

minimize the shock at the end of the stroke. Write: Pines Engineering Co. Inc., 601 Walnut St., Aurora, Ill. Phone: Aurora 6-7700

## Screw Machine

This hand screw machine handles short production runs, from 50 to 1000 pieces. It can make wide variety of parts, from simple washers and shafts to intricate parts used in the electronic and aircraft industries.

The bed turret has six stations. A turn of the pilot wheel moves the turret from one operation to the next.

The pilot wheel feed combines rapid slide movement with an 8-in. travel which increases the size range of jobs the machine can perform. Write: Delta Power Tool Div., Rockwell Mfg. Co., 475 N. Lexington Ave., Pittsburgh 8, Pa. Phone: Churchill 1-8400

## Ultrasonic Cleaner

Model AP-200 Sonogen cleans whenever a surface is in contact with the cleaning liquid. It removes insoluble solids and contaminants. Oil in sintered parts, blind holes, and complicated crevices is washed out easily.

The generator has an average power output of 1 kw with a peak on pulses of 4 kw.

A flexible 6-ft cable connects the generator to a tank-transducer combination. A 25-gal capacity unit is generally used.

The unit cleans by supplying 38 kilocycle pulsed power to the immersed transducer, which converts

## Bearings "keep cool" under hot steel!

**HIGHER FLANGE  
IMPROVES ROLLER ALIGNMENT**

*As shown by the gray area above, the higher flange provides a large two-zone contact area for the roller heads. This greatly reduces wear—practically eliminates "end play". Larger oil groove provides positive lubrication.*

Watch it! Coming down the line—another half-formed slab of red-hot steel! And with it comes a supreme test of bearing excellence. Bower Bearings are equal to it—helping to keep this mill operating smoothly and continually despite heavy loads and extreme temperature. Whatever the job, there's a Bower Bearing engineered to perform just as dependably when the going is toughest. Rigid quality controls and basic bearing design refinements like those shown at the left have reduced Bower Bearing failure to a practical minimum. If your product uses bearings, specify Bower! There's a complete line of tapered, straight or journal roller bearings for every field of transportation and industry.

*This Niagara Aero After Cooler also cools compressor jacket and intercooler water.*

## COMPRESSED AIR

- Lower in Cost
- Drier and Cooler

THE NIAGARA AERO AFTER COOLER offers a completely self-contained method replacing both shell-and-tube cooler and cooling tower. It is independent of a large supply of cooling water and consistently reduces compressed air temperatures to below ambient.

Drier air gives you better operation and lower costs in using all air-operated automatic instruments, tools and machines, paint spraying, sand blasting and moisture-free air cleaning.

Direct saving in the cost of cooling water saves the price of the Niagara Aero After Cooler in less than two years.

Niagara Aero After Cooler assures all these benefits because it cools compressed air or gas below the temperature of surrounding atmosphere; there can be no further condensation in your air lines. It condenses the moisture by passing the air through a coil on the surface of which water is evaporated, transferring the heat to the atmosphere. It is installed outdoors, protected from freezing in winter, proven in service on the largest plant utility systems.

## R-C centrifugal blowers assure accurate control of volume and pressure

At any speed, Roots-Connorsville centrifugal blowers assure uniform delivery of air or gas without the use of receivers. In matching supply to changing demand, this inherent operating advantage simplifies accurate and instantaneous control of volume and pressure.

R-C centrifugals may be direct-connected to high speed electric motors or turbines. Operating speeds may be further raised with speed increasing gears. Occupying a minimum of space and perfectly balanced, with semi-rigid bearing supports to dampen vibration, they do not require special, costly foundations.

Liberal design of diffuser and return passages results in low velocities, normal efficiency even when build-up occurs and exceptionally quiet operation. Operating without internal lubrication, oil-free air is discharged, making it ideally suited for exacting process applications. For complete specification details, write for Bulletin 120-B-14.

.....  
**Engineers**—unusual career opportunities await you at Roots-Connorsville. Address your resume to Professional Employment Manager.

following strip.

Four welding wheels move across the overlapped edges, joining the two strips. Mechanical transfer devices in the welder receive the strip, position it, and move it toward a continuous heat treating line after it is welded.

Two 250-kva transformers power the machine. Write: Taylor-Winfield Corp., Warren, Ohio. Phone: 2252-1

## Vertical Milling Machine

The Model 200 mill is driven by a built-in motor. The rotor, placed at the rear of the ram for balance, mounts directly on the first change gearshaft to transmit power directly.

Lapped, spiral bevel gears are used for the final angle reduction to provide the quiet, smooth spindle speeds needed for good surface finishes. Twelve spindle speeds are provided in a range of 80 to 2100 rpm for the 2-hp machine.

An opening between the knee and the column face allows chips to pass through.

The overarm turret, 15 in. in diameter, permits accurate positioning of the spindle head over a large work area.

A 1-hp model is suited for tool-room use. Write: Famco Machine Co., Kenosha, Wis. Phone: Olympic 4-3516

## Fork and Ram Trucks

The 15,000 and 16,000 lb capacity models of the K-48 line are suited for lightweight coil handling in the nonferrous metals industry.

The trucks measure 124 in. from the rear of the counterweight to the face of the fork carriage and are 61 in. wide.

Dual operating stations provide

extra visibility. The truck can be powered by a battery or by a diesel or gasoline engine. Write: Yale Materials Handling Div., Yale & Towne Mfg. Co., 11000 Roosevelt Blvd., Philadelphia 15, Pa. Phone: Orchard 3-1200

# NEW!

Now equipped with a new and larger Onan 12.9 hp engine, the new Miller AEA-200-L produces a full 225 amperes of continuous rated, high cycle welding current or, 5 KW of 110/220 ac power for operation of power tools, lights, milking machines, etc., or, 1 KW of dc power.

Contractors, job weldors, farmers and many industries have shown a continuing high regard for the AEA's weatherproof ruggedness, easy portability and instant changeover versatility from ac welder to power plant to pipe thawer.

Readi-pull starter, rubber tire running gear and road trailer available as optional equipment.

Complete specifications sent on request.

"... if it's Miller you know it's the finest ..."

### Electric Manufacturing Company, Inc.

APPLETON, WISCONSIN

distributed in Canada by CANADIAN LIQUID AIR CO., LTD., Montreal

This brake is so large that the bed had to be detachable because of railroad clearance limitations encountered in shipping. It bends 20'-0" x 1/2" steel plate and is equipped with Steelweld's own tried-and-proven air-operated clutch and brake.

## STEELWELD

### BUILDS LARGE PRESS BRAKES

Regardless of Size — Small or Large — Steelwelds Have Much to Offer

**A**LTHOUGH Steelweld Brakes are built in a wide range of sizes, it is in the large classification where Steelweld's many fine features really show up. Brakes used for forming long plates—15, 20, 25 feet—or for working metal

thicknesses of 1/4 inch to 1 1/2 inch, must be quality built to operate day in and day out on a continuous production schedule.

The entire line of Steelwelds is heavily built to withstand hard, rugged service. Steelwelds have all the features that make for fast set up, easy operation, accuracy of work, high output and simple infrequent maintenance.

We urge you to get the facts on these fine, quality-built machines.

# FOOTE BROS. SPLINE DRIVE PINION

## Takes 35 "Bites" \*

### to guarantee better power transmission

360° LOCKING ACTION OF 35 SPLINES  
POSITIVELY ANCHORS PINION TO SHAFT

## SPLINE DRIVE PINION

advantages:

### 1. MORE LOCKING AREA

Self-broaching splines provide more internal locking surface than any other pinion ... assure positive anchoring, even under reversing conditions.

### 2. GREATER STRENGTH

Gear and shank are machined from one piece. Solid construction and spline lock provide greater strength—no weakness due to projecting keyway.

### 3. PERMANENT, ACCURATE ALIGNMENT

Self-centering action of ground pinion shank in the accurately bored high speed shaft assures accurate assembly and alignment for smoother performance.

### 4. DUTI-RATED GEARING

Foote Bros. Spline Drive Pinions have the famous Duti-Rated Gear—harder, tougher and more accurate, with greater load carrying capacity for their size than any other gearing.

**SPLINE DRIVE PINIONS** are another example of Foote Bros. leadership ... another reason you can be sure you're buying the finest when you buy Foote Bros. Power Transmission Equipment.

## Barrel Finishing

An aluminum oxide abrasive (chips and screened grain sizes) for barrel finishing is described in a 4-page bulletin, ESA-236. Simonds Abrasive Co., Tacony and Fraley Streets, Philadelphia 37, Pa.

PUBLIC reception of new automobiles will figure prominently in steel industry planning the next several months. Steelmakers are looking to autos to provide the nudge in demand needed to get ingot operations out of the rut.

**PROMISING SIGN**—The fact auto production is spurting at a faster pace than it was a year ago is encouraging.

The statistics: Passenger car output in the week ended Nov. 2 was 127,991 units, more than five times the number produced in the first week of October. It compares with 104,987 in the preceding week and 117,583 in the like week last year.

**INSURANCE PRODUCTION**—Steelmakers are aware that volume auto steel needs may develop before public acceptance of the new cars is clearly demonstrated. They reason: Should a mid-1958 auto strike threaten, builders may step up their schedules early next year to assure adequate dealer stocks of cars later.

**SITUATION MIXED**—Steel market conditions generally appear mixed. In some areas, demand is holding steady; in others, it is still contracting. Over-all, the trend seems to be downward.

The comparatively easy situation largely mirrors consumers' efforts to hold inventories down, since it is generally agreed consumption is outstripping new orders.

**OPENING BOOKS**—Mills are opening books for first quarter orders on virtually all products. But incoming business is light, and producers are not too confident a pickup of substantial proportions will come this quarter.

Automakers are taking about the same tonnage as they have recently, and give no indication of increasing requirements soon. Some appliance makers are doing well (home laundry equipment), but road machinery sales are disappointing, and manufacturers are curtailing. Construction is waning seasonally.

**EASINESS SPREADS**—Sheets and bars have been in easy supply for months. Shapes and plates, which have been in critical supply, are getting into better balance rapidly. One shapemaker is no longer allocating ahead.

The move reflects seasonal slackening in structural activity, including highways and bridges.

**INQUIRY SLACKENS**—Makers say inquiry for sheared plates is leveling out, with capital expenditures dipping. They still hold substantial backlogs, but pressure is off the market.

Heavy shipyard needs are expected through next year; but utility work is down; chemical requirements are not nearly so active as they were a year ago; railroad car needs are off.

**SCRAP SINKING**—Disinterest of consumers has forced scrap prices down again for the twelfth consecutive week. STEEL's composite last week dropped another \$2 to \$33.33, the lowest since December, 1954.

Except for a reduction of \$5 a ton on wide flange beams by Inland Steel Co. to make it competitive with other sellers, there were no significant steel price changes last week. STEEL's composite on finished steel is \$146.03.

**PRODUCTION**—Steelmaking operations last week held steady at 79 per cent. This is equal to output of about 2,021,000 net tons.

# Steel Imports Aren't Breaking Records, But They Still Pain Domestic Producers

Foreign barbed wire sells for as much as \$3 a spool less than the U. S. product; fencing is \$20 a ton cheaper; and nails are \$30 a ton under the domestic price

IMPORTS of steel are declining, but domestic producers who have been hurt the most feel little or no relief.

Reason: Wire mill products—more specifically, the merchant items—continue to cause a lot of headaches.

The decline in principal imports chiefly concerns structurals and tubular goods. Since demand for them was heavy in the domestic market, they weren't much of a competitive factor. Their tonnages were small, compared with domestic production.

**Small but Mighty**—Imports of steel mill products are equal to only 1.5 or 2 per cent of U. S. production. But competition depends upon the product and the geographic area it is concentrated in. Steel mill products imported in the first seven months of this year totaled 804,735 net tons. U. S. mill shipments totaled 50,162,861 tons.

In contrast, barbed wire imports (38,297 net tons) were equivalent to 83 per cent of U. S. mill shipments of that product. Nail imports (75,975 tons) were equal to

26 per cent of U. S. mill shipments, and fence imports (16,611 tons) were equal to 10 per cent of U. S. mill shipments.

**Flooded**—Eighty-seven per cent of the barbed wire imports landed at East Coast and Gulf Coast ports; so did 56 per cent of the nails and 74 per cent of the fence.

They continued the squeeze on wire mills in the eastern and southeastern part of the U. S. In 1956, Atlantic and Gulf Coast ports received 91 per cent of the barbed wire imports, 63 per cent of the nail imports, and 80 per cent of the fence imports.

**Concentrated**—Imports of reinforcing bars in the first seven months of 1957 were only 7.5 per cent as large as U. S. mill shipments of them. Their entry was concentrated in Florida. Of the 114,169 net tons of them, 52,176 (46 per cent) arrived at the Sunshine State's ports. The other two main entry points for RE bars were Galveston, Tex., (34,146 tons), and Los Angeles (2893 tons).

**No. 1 Port**—Galveston received more tonnage of steel mill product

imports in the first seven months of this year than any other port. Arriving there were 174,990 net tons—21 per cent of the total imports of 804,735 tons. It also led in another category: It received more structurals than any other port in the first seven months. Imports of structurals at all the ports totaled 259,146 tons, equivalent to 6 per cent of the amount shipped from U. S. mills. Structural imports slipped from 50,776 net tons in January to 17,976 tons in July, reflecting the catching up of supply with demand.

**Main Exporters**—Principal shippers of steel mill products to the U. S. in the first seven months were Belgium and Luxembourg. They accounted for 346,611 net tons (43 per cent). Next was France with 140,957 tons (17 per cent). Third was West Germany with 132,372 tons (16 per cent). Japan supplied only 13,159 tons (1.6 per cent).

The squeeze on wire mills in the Southeast has forced their wire operations down to 60 per cent or less of capacity. On merchant wire products, the situation is even worse. One producer who has a capacity of around 2000 tons of barbed wire a month received orders for only 23 tons in the first three weeks of October.

**Skimming the Cream**—The bulk of the imports are the common, easy-to-make products. The business that's left for the domestic producers is in harder-to-make and specialty products.

The reason imports continue to come in is that they are priced lower than their domestic counterparts. Eighty-seven-pound spools of foreign barbed wire have been selling for as much as \$3 a spool less than the domestic product in some South Atlantic and Gulf Coast ports. Imported fencing has been averaging at least \$20 a ton less than the American-made product. Imported nails are as much as \$30 a ton less than domestic nails. U. S. producers report that the imported items are of good quality.

**Low-Cost Labor**—Low labor rates in foreign mills account for much of the price differentials. In Western Germany, the average steelworker gets 65 cents an hour for a 48-hour week. A skilled

German steelworker receives 75 cents an hour. In the U. S., the minimum wage for steelworkers is \$1.89 an hour. The average hourly wage paid is around \$3.

One of the things that has put foreign mills into a strong position to compete with American mills is the U. S. government's postwar foreign aid program. Millions of U. S. dollars (in low-interest loans and outright gifts) have gone into the rehabilitation of Western Europe's war-ravaged

steel mills. These rebuilt plants are modern and efficient.

**What To Do?**—U. S. mills are perplexed. Some of them with merchant wire products equipment have barely enough business to keep it going, but they are reluctant to scrap it. They like to have as complete a product line as possible, and they don't think the nation should become dependent upon foreign producers.

**The Solution?** — One company hurt by the imports says: "If

somehow we could get the foreign countries up into a position where they would need all of their own steel, they wouldn't be shipping it into the U. S."

## Imported Bars Easier

A slight easing is noted in prices on deformed bars imported from Europe. Other major items are steady, but easy, with no buying pressure evident in any product.

Deformed bars are lower at \$6.28 per 100 lb, landed, duty paid, North Atlantic ports; \$6.23, South Atlantic and Gulf ports; and \$6.48, West Coast.

## Steel Bars . . .

Bar Prices, Page 170

With mill deliveries easy, hot carbon bar consumers continue to cover on a nearby basis, and, in most cases, at a level not comparable with their consumption. Some fastener makers, for instance, have reduced stocks to 30-day requirements, compared with 60 to 90 days normally. These manufacturers are operating at 60 to 65 per cent of capacity, but still their stocks are relatively light.

Consumers indicate there will be no change in their present conservative buying policy until there is some upturn in demand for their products.

A Pittsburgh producer calls the cold drawn bar market "dull," but points out that there were no order cancellations for November, indicating inventories are getting low.

Alloy bars are moving slowly. But makers of plow blades are increasing their purchases. Strong demand from this sector through the first quarter next year is seen.

## Stainless Steel . . .

Stainless Steel Prices, Page 174

Demand for stainless is picking up with the introduction of 1958 automobiles, E. J. Hanley, president, Allegheny Ludlum Steel Corp., Pittsburgh, said in San Francisco recently. Silicon steels in the lower grades are also experiencing a pickup.

Production of stainless and heat resisting steel ingots in the third quarter this year totaled 221,260

# THOMAS FLEXIBLE COUPLINGS

Give You Freedom From Coupling Maintenance

**NO LUBRICATION**

**NO MAINTENANCE**

**NO WEARING PARTS**

Future maintenance costs and shut-downs are eliminated when you install Thomas Flexible Couplings. These all-metal couplings are open for inspection while running.

They will protect your equipment and extend the life of your machines. Properly installed and operated within rated conditions, Thomas Couplings should last a lifetime.

Under Load and Misalignment only Thomas Flexible Couplings offer all these advantages:

- 1 Freedom from Backlash  
Torsional Rigidity
- 2 Free End Float
- 3 Smooth Continuous Drive with  
Constant Rotational Velocity
- 4 Visual Inspection While  
in Operation
- 5 Original Balance for Life
- 6 No Lubrication
- 7 No Wearing Parts
- 8 No Maintenance

**THOMAS FLEXIBLE COUPLING COMPANY**  
WARREN, PENNSYLVANIA, U.S.A.

net tons, reports the American Iron & Steel Institute. This compares with output of 249,470 tons in the second quarter, and with 235,455 tons in the third quarter a year ago.

Cumulative output in the first nine months this year was 793,733 net tons, compared with 849,746 in the like period of 1956.

## Tool Steel . . .

Tool Steel Prices, Page 174

Shipments of high speed and tool steel (excluding hollow drill steel) totaled 7915 net tons in September after deducting 202 tons shipped for conversion or resale, reports the American Iron & Steel Institute. This compares with 7479 tons in August, and with 9426 tons in September, 1956.

Cumulative shipments this year through September amounted to 77,511 net tons, against 96,515 in the like period last year.

## Tin Plate . . .

Tin Plate Prices, Page 172

Tin plate sales are declining. The normal seasonal drop is being accentuated by a determined effort of consumers to trim heavy stocks which resulted when crops failed to meet expectations.

The slump in buying is thought likely to hold through this quarter. Improvement in demand is expected shortly after the turn of the year.

## Plates . . .

Plate Prices, Page 170

Platemakers are beginning to open their order books for first quarter, 1958. On heavy sheared plate, they will enter the period with backlogs averaging about a month's production. On light sheared plate, universal and strip plate, though, the story is different. Supply is more than adequate, especially in the universal and strip grades.

One of the softest spots demandwise is the car building industry. The car builders, it is said, have plenty of tonnage for current requirements and see little ahead in the way of new car work.

Heavy inquiry for sheared plates has leveled off, following the easing in strip-plate and universal

plate in recent weeks. One large producer is still well behind on commitments on heavy plates, and another will enter the new year with a carryover of at least three to four weeks. Still another would be well behind had it not reduced acceptances for September and October.

## Sheets, Strip . . .

Sheet & Strip Prices, Pages 171 & 172

Sheet buyers, including the auto industry, are still reluctant to

place forward orders.

The producers of cold-rolled sheets no longer anticipate a sharp upswing in activity this quarter. Demand is shrinking in some areas of the market; manufacturers of office furniture, for example, are trimming purchases in line with the general tendency to lower inventories. They had been taking relatively large tonnages.

At best, demand is spotty. Needs of container manufacturers, stove-makers, and converters are hold-

no crane of comparable quality

**ABELL-HOWE  
COMPANY**

Forest Park, Illinois

ing up fairly well, but light tank-work and building trade requirements are off seasonally, and the warehouses are specifying smaller tonnages.

Auto builders appear to be concentrating on orders for "spot tonnages" rather than maintaining a steady, unbroken demand. So sheet mills have only moderate orders on books for December and few orders for January shipment.

Gains are predicted for automotive orders in the first quarter. By that time, public reception of the 1958 model cars will be clearly defined. Even though auto sales should fail to meet expectations, the threat of a strike in the industry next summer will probably spur production in the first half. Heavy sheet ordering should result.

Republic Steel is reviving its production of terne plate. It has completed a continuous terne line at its Warren, Ohio, plant.

## Rails, Cars . . .

Track Material Prices, Page 173

Normally, some fairly sizable rail tonnages come out for bidding in the East about this time of year. Currently, though, demand is nil. Also, there are no indications of important inquiries being issued in the immediate future. One railroad is considering tentatively the purchase of a modest tonnage, although it still has rails on hand bought two years ago.

## Tubular Goods . . .

Tubular Goods Prices, Page 174

Pipe sellers are concentrating on plans for 1958 sales. Many have about abandoned hope of an upswing in demand over the remainder of this year. Plumbing and heating industry requirements are dropping seasonally—fourth quarter demand is slower than it has been in recent years.

Some producers of oil country tubular goods are operating at levels in excess of demand. They're taking advantage of the decline in sales of carbon tubular products to build up their supplies at distributing points in the Southwest. Conditions are expected to be highly competitive in oil country goods in the first quarter next year; sellers in position to provide supplies

### FEDERATED SILICON BRONZES

have ductility of 50% or better, with tensile strength up to 65,000 psi.

### FEDERATED ALUMINUM BRONZES

heat treated, have tensile strength as high as 120,000 psi with correspondingly high yield strength.

### FEDERATED MANGANESE BRONZES

have as-cast tensile strength as high as 125,000 psi with good ductility and high hardness.

### FEDERATED ENGINEERED BRONZES

all have excellent corrosion resistance.

*Federated* products:

Aluminum, Babbitts, Brass, Die Casting Metals, Fluxes, Lead and Lead Products, Magnesium, Plating Materials, Solders, Type Metals, Zinc Dust

## Have you had trouble with Engineered Bronzes?

The truly engineered bronzes... silicon, aluminum and manganese bronzes... give desirable combinations of properties not available in any other metals.

If you need the physical characteristics of the engineered bronzes, but if you have had difficulty in achieving them in castings, it will be worth your while to try again with Federated products.

It is difficult to make these bronzes and only many years of experience and rigid quality control will produce the metallurgical qualities desired. At Federated, ingredient specifications are adhered to rigidly. Continual spectrographic and chemical controls are used during the alloying process. Experienced metallurgists are in charge. Performance specifications are always met or exceeded.

Let us tell you more about these valuable alloys. A Federated field man will be around to see you soon. Talk to him. It will benefit you.

# Federated Metals

Division of

**AMERICAN SMELTING AND REFINING COMPANY**

120 Broadway • New York 5, N. Y.

In Canada: Federated Metals Canada, Ltd., Toronto and Montreal

quickly (and in the sizes and tonnages required) will get the business. Stronger demand is anticipated in the second quarter.

Electricweld pipe in four standard sizes between 6 $\frac{5}{8}$  in. and 12 $\frac{3}{4}$  in. OD, is now being offered by Jones & Laughlin Steel Corp., Pittsburgh. It can be produced in lengths up to 60 ft.

## Warehouse . . .

Warehouse Prices, Page 175

Bookings by distributors are fair, consisting principally of quantities considered small, even when measured by jobbing standards. Buyers are taking tonnages mainly for immediate needs. No substantial improvement is expected through the fourth quarter.

Several smaller warehouses in the Pittsburgh district are expanding their services in distributing such products as roofing and strapping. It is being done in an effort to make up for lagging sales of flat-rolled steel products.

November sales of several items, including sheets, bars and pipe, have fallen below October levels, and October was considered a dull sales month. Demand for such products as plates and standard shapes has slipped.

## Pig Iron . . .

Pig Iron Prices, Page 175

Most merchant pig iron sellers expect a slight decline in November and December business. They see indications of additional easing in foundry operations over the remainder of the year. Foundries are making no effort to replenish raw material stocks, reduced substantially in recent months, especially in October. Frequently, shipping orders carry a "rush" tag, indicating new orders closely parallel consumption.

Foundries which make castings for the appliance and automotive industries are operating well below capacity. A decline in house construction starts has adversely affected demand for castings going into heating equipment.

Due to lessened demand for pig iron from foundries and to curtailment in steelmaking operations, mills are gradually reducing blast furnace operations. Sharon Steel Corp. has taken off a stack at its

Everybody profits  
...because  
**you**  
**belong**  
in this  
picture!

The publisher of this magazine is often asked what kind of a man you are ... and how many like you are receiving his magazine. Why is he asked?

Because the *advertisers* (whose money is his chief income) insist upon knowing the types of people (by industry or profession, by title) for whom the magazine is edited — and how many are getting it.

In order to standardize on the presentation of such information to advertisers and to have its accuracy vouched for by a disinterested third party, nearly 450 publishers have joined some 200 leading advertisers and advertising agencies in a non-profit organization called Business Publications Audit.

The purpose of BPA is to assure advertisers ... by frequently checking and rechecking ... that each member publisher is indeed distributing his magazine, in the *numbers* promised, to the *types* of men he promised would receive it.

The BPA symbol in this magazine means that *you belong* ... that because of your occupational interests you are qualified, in the eyes of the advertisers, to receive it.

The advertiser can thus tell whether he's getting his money's worth.

The publisher has a better sales story to prospective advertisers because his magazine is "audited."

And you, the reader, get more value from the magazine because both the advertisers and editors, knowing what your special occupation is and what your interests are, are better able to prepare advertising and editorial material that will be most informative and useful to you.

#### **What you can do**

Publishers and advertisers frequently write to magazine readers to learn what kind of articles and advertisements appeal most. Cooperate with them — will you? — by answering their questions ... in the interest of better communications between makers and markets.

**BUSINESS PUBLICATIONS  
AUDIT OF CIRCULATION, INC.**

Roemer Works, Farrell, Pa., for a two-week relining job. Sharon also has banked its Mary furnace at Lowellville, Ohio. Officials say the company has accumulated an inventory at that point.

Republic Steel Corp. shut down a second small blast furnace at Cleveland, attributing the move to a drop in merchant iron demand.

## Iron Ore . . .

Iron Ore Prices, Page 176

Cleveland-Cliffs Iron Co., Cleveland, representative in the U. S. for the Vale de Rio Doce Co. of Brazil, last week reported that the price of Itabira lump ore (produced by Rio Doce) will hold unchanged through 1958 at \$14.60 a gross ton, f.o.b. vessel, Brazilian port of Vitoria, based on 68.5 per cent dried iron.

Any increase in labor cost, rail freight, and forwarding costs in Brazil will be absorbed by Rio Doce. Lowered vessel rates should make delivered prices at eastern seaboard ports lower than those prevailing this year.

Itabira ore production this year will total about 3 million tons. Well over that is indicated for 1958, half going to the U. S. and Canada, and the other half to Europe and Japan. Rio Doce plans expansion so that 6 million tons can be shipped by 1960-62 yearly.

The Interstate Commerce Commission has authorized the New York Central Railroad to cut its rate 28 cents a ton on carloads of Labrador iron ore shipped from Contre-Coeur, Canada, to the Youngstown area. At the same time, the ICC said railroads shipping similar traffic from Baltimore and Philadelphia must maintain their present rates.

At the beginning of November, at least 40 vessels of the Great Lakes ore fleet of 251 were being laid up or were already in winter quarters.

Shipments of Lake Superior iron ore in the week ended Nov. 4 totaled 2,023,272 gross tons, reports the American Iron Ore Association. In the like week last year, 2,753,374 tons were moved.

Cumulative shipments to Nov. 4 are reported to be 81,384,292 tons, up 12,859,084 tons from the movement in the like 1956 period.

# Ready-Power LPG-Electric Power Unit for Sit-Down Trucks

**MODEL HA-3 FOR 4000-6000 LB. FORK TRUCKS**

Now, get the advantages of full-time LPG-electric power for *any* electric, sit-down fork truck, regardless of make or model. Compact Ready-Power model HA-3 accommodates all seating arrangements . . . assures remarkably low-cost operation . . . minimizes objectionable fume problems. Compact LP-Gas cylinder is mounted on top of engine-generator housing for quick, easy interchangeability. Hinged cover and side plate give easy access to engine accessories; removable end plate permits service of generator. LP-Gas components are listed by Underwriters' Laboratories and comply with Factory Mutual recommendations. Write today for full information.

Flexible LP-Gas fuel lines withstand vibration . . . quick-disconnect coupling assures safe refueling.

LP-Gas cylinder is standard I.C.C. 33½-lb. or 43½-lb. capacity. A.S.M.E. tank is optional.

Recessed housing accommodates seating arrangement for all electric sit-down fork trucks.

Instrument panel is within easy reach of operator, protected against damage.

## READY-POWER

**The READY-POWER Co., 3824 GRAND RIVER AVE., DETROIT 8, MICH.**

*Manufacturers of Gas and Diesel Engine-Driven Generators and Air Conditioning Units; Gas and Diesel-Electric Power Units for Industrial Trucks*

## Structural Shapes . . .

Structural Shape Prices, Page 170

Indicative of the easier situation in shapes, one large producer is no longer allocating tonnage ahead. He is accepting about whatever is offered by regular customers. This applies to wide flange sections as well as standard shapes. The move reflects a general reduction in structural activity.

Inland Steel Co. reduced its price on wide flange beams \$5 a ton, effective Nov. 1. This brought its published quotation to \$5.275 per 100 pounds, f.o.b. Indiana Harbor, Ind.

The company had established a base price on this product on Jan. 1 which was \$5 above prices quoted for structural shapes in the Chicago area. The action was taken because the established price did not provide an adequate return on Inland's investment in new facilities for the production of wide flange beams.

An increase of 28 per cent in structural steel tonnage in 1957, compared with that in 1956, has

brought supply into balance with demand except for wide flange heavier sections. Even these show definite supply improvement. The mills may be caught up on schedules by yearend.

While bridge tonnage for New York state is heavy, including contracts for over 20,000 tons, building and other engineering estimates are down, educational structures excepted.

More shops are estimating individual projects, including bridges. Inquiries in the East are bringing out twice the number of early 1957 estimates for fabricated structural steel. On a 3300-ton state bridge in Westchester County, N. Y., recently, 18 fabricators indicated their intention of submitting bids.

## RAILS, CARS . . .

### LOCOMOTIVES PLACED

South African Railways, forty-five, 1320 hp, diesel-electric locomotives, to the General Electric Co., Schenectady, N. Y.

### RAILROAD CARS PLACED

Bangor & Aroostook, 150 pulpwood cars, to the Magor Car Corp., Passaic, N. J.

## STRUCTURAL SHAPES . . .

### STRUCTURAL STEEL PLACED

18,000 tons, towers and anchorages, Through Neck suspension bridge, East River, New York, to Bethlehem Steel Co., Bethlehem, Pa.; 11,000 tons, fabricated structural steel for towers and anchorage metal work, at 7000 tons, plain material, foundations for two towers, Merritt-Chapman & Scott Corp. contractor; bid to Triborough Bridge Tunnel Authority.

4600 tons, nine-story office building, South New England Telephone Co., New Haven, Conn., to Topper & Griggs, Hartford, Conn.; Edwin Moss & Son Inc., Bridgeport, Conn. general contractor.

1900 tons, state bridge work, Onondaga County, N. Y., through Bero Construction Co., Waterloo, N. Y., to Phoenix Bridge Co., Phoenixville, Pa.

1450 tons, bridge widening, Connecticut Turnpike, Jewett City, Conn., to City Iron Works, Hartford, Conn.; M. A. Gammino Co., Providence, R. I., and Brunelli Construction Co., Southington, Conn., joint contractors.

1090 tons, state highway structures, Saratoga Washington counties, New York, Colorado Fuel & Iron Corp., Claymont, Del.; A. Johnson Corp. and Peter Kewitt & Son Contracting Co., New York, joint contractors.

630 tons, plant and office building, Inland Container Corp., Franklin Park, Ill.; Indiana Bridge Co., Muncie, Ind.; Batace Cook Co., West Point, Ga., general contractor; reinforcing bars, Ceco Steel Products Co., Chicago.

630 tons, transmission towers, Long Island Lighting Co., Nassau County and Rock Point, N. Y., to Lehigh Structural Steel Co., Allentown, Pa.

600 tons, service center, Consumers Power Co., Saginaw, Mich., to Taylor-Gaskin Co., Detroit; Spence Bros., Saginaw, general contractor.

380 tons, research center, Grand Island, N. Y., to Bethlehem Contracting Co., Bethlehem, Pa.; Wigton-Abbott Corp., Newark, N. J., general contractor.

305 tons, office building, Peoples Life Insurance Co., Washington, D. C., to Belmed Iron Works, Philadelphia; Charles H. Thomkins Co., Washington, general contractor; reinforcing bars, Bethlehem Steel Co., Bethlehem, Pa.

300 tons, service center, Brooklyn Gas Co., Brooklyn, N. Y., to Deleson Steel Co., New York.

250 tons, transmission towers, Public Service Electric & Gas Corp., Bergen County, N. J., to Lehigh Structural Steel Co., Allentown, Pa.

200 tons, angles, General Stores Supply Office, Navy, Philadelphia; to Oregon Steel Mills, Portland, Ore.

190 tons, dormitories, Rhode Island School of Design, Providence, R. I., to Provident Steel & Iron Co., Providence; E. Turgeon Construction Co., Providence, general contractor.

150 tons, school, Grover, Tex., to Joe R. Turner Co., Houston; Farnsworth & Chamber Co. Inc., Houston, general contractor.

115 tons, angles, General Stores Supply Office, Navy, Philadelphia, to Penn Galvanizing Co., Philadelphia.

110 tons, school, Port Neches, Tex., to Capital Steel & Iron Co., Houston; also 30 tons reinforcing bars; Farnsworth & Chamber Co. Inc., Houston, general contractor.

105 tons, bridge, New York Central Railroad, Syracuse, N. Y., to the Bethlehem Steel Co., Bethlehem, Pa.

105 tons, bridge, New York Central Railroad, Park Street, Syracuse, N. Y., to Bethlehem Steel Co., Bethlehem, Pa.

### STRUCTURAL STEEL PENDING

3350 tons, state highway bridges, Westchester County, N. Y.; Mt. Vernon Construction Co., Mt. Vernon, N. Y., low on general contract.

3300 tons, state bridge work, Westchester County, N. Y., Mt. Vernon Construction Co., Pelham, N. Y., low on general contract.

1500 tons, office building, State Department, Education, Albany, N. Y.; bids Nov. 22, Albany, N. Y.

1030 tons, Ferris Booth Hall and dormitory, Columbia University, New York, Laskey

## PIONEERS in manufacture and design of CRUCIBLES For VACUUM MELTING

Since the practical application of the theory of vacuum melting, Zak Machine Works, Inc., pioneered the design and manufacture of crucibles for vacuum melting in a variety of sizes.

THE ONLY COMPANY to test vacuum pump down and leak rate at the plant and issue a *certification of testing!* This certification guarantees Vacuum Test and Leak Rate measured in microns.

# Iron Ore Stocks Larger

Stocks of iron ore in the U. S. and Canada (all sources) at the end of September totaled 65,172,864 gross tons, reports the American Iron Ore Association and the American Iron & Steel Institute. The total is up substantially from the 53,906,551 tons held in September last year.

Receipts of iron ore and agglomerates totaled 16,928,275 tons in the month, compared with 17,720,801 a year ago. Receipts in the first nine months this year amounted to 108,730,561 tons, against 89,032,303 in the like period of 1956.

Consumption of iron ore in September totaled 10,973,402 tons, against 11,432,300 in the like month a year ago. Consumption in the first nine months this year was 102,070,690 tons, against 89,815,800 in the like period last year.

There were 239 blast furnaces operating on the last day of September out of a total 273 in the U. S. and Canada. This compares with 262 on the like date last year.

Detailed statistics for September are given in the accompanying table.

## STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL

# Scrap Prices Are Still Sinking

Consumers' disinterest is reflected in continued sharp drop in quotations. STEEL's composite falls another \$2 to \$33.33. It's the lowest level since December, 1954

Scrap Prices, Page 182

**Pittsburgh**—Supply of scrap is dwindling as prices continue to decline. Last week, a mill on the fringe of the Pittsburgh area placed a small order for No. 1 heavy melting at \$32, No. 2 heavy melting at \$29, and No. 2 bundles at \$26. It was the first activity locally for several weeks, and it met with some resistance. Holders of scrap are reluctant to sell it at present quotations. Some brokers say that the market has touched bottom.

On latest railroad lists, prices declined an average of \$3 a ton. Prices of other grades dropped, also. Despite scattered signs of resistance to lower prices, the market needs a sharp upturn in volume to generate any strength.

**Philadelphia**—Light buying by district mills is resulting in further declines in prices on some steelmaking grades. No. 1 heavy melting is lower at \$35.50, delivered, and No. 2 heavy melting at \$32.50. No. 2 bundles are down to \$26.50, delivered, and electric furnace bundles are off to \$41. Heavy breakable cast is quoted down \$1 at \$40. Other grades are unchanged and mostly nominal.

**New York**—Scrap brokers have reduced prices on No. 2 bundles to \$21-\$22, and on 18-8 sheets, clips and solids to \$155-\$160. Other grades are unchanged—and for the most part untested.

**Boston**—Steel scrap prices may have plumbed bottom with the exception of No. 2 bundles, which are off \$3 a ton to \$15-\$16, shipping point. Brokers' prices for the primary grades are unchanged. New buying and shipments of cast iron grades are light. Some observers are of the opinion steel scrap prices have settled to a low point and that the next move will be toward a stronger trend.

**Chicago**—The local scrap market is listless, with purchases at a minimum and the price level still settling. Price changes during the past week were the fewest in several.

At 80 per cent of capacity, steel-making is at its lowest point since early November, 1954. Consumers' stocks of scrap are good, and plenty of material is available.

**Cleveland**—The market is off another \$1 a ton on the steel grades, but quotations are nominal in the absence of representative mill buying. A small buy at

Youngstown last week is setting the market pace. Some railroad No. 1 heavy melting went to a Youngstown mill last week at \$36. The cast grades are weak, and prices are off on most grades.

Unprepared material is beginning to pile up in dealers' yards, but the situation here is not too bad. Other yards have curtailed operations severely.

**Youngstown**—The scrap market is weaker. There have been no

# Iron and Steel Scrap

Consumer prices per gross ton, except as otherwise noted, including broker's commission, as reported to STEEL, Nov. 6, 1957. Changes shown in italics.

## STEELMAKING SCRAP COMPOSITE

Nov. 6	\$33.33
Oct. 30	35.33
Oct. Avg.	37.37
Nov. 1956	61.83
Nov. 1952	43.00

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania.

## PITTSBURGH

No. 1 heavy melting	31.00-32.00
No. 2 heavy melting	28.00-29.00
No. 1 factory bundles	35.00-36.00
No. 1 dealer bundles	31.00-32.00
No. 2 bundles	25.00-26.00
No. 1 busheling	31.00-32.00
Machine shop turnings	17.00-18.00
Mixed borings, turnings	17.00-18.00
Short shovel turnings	20.00-21.00
Cast iron borings	20.00-21.00
Cut structurals:	
2 ft and under	38.00-39.00
3 ft lengths	37.00-38.00
Heavy turnings	30.00-31.00
Punchings & plate scrap	37.00-38.00
Electric furnace bundles	37.00-38.00

### Cast Iron Grades

No. 1 cupola	41.00-42.00
Stove plate	35.00-36.00
Unstripped motor blocks	28.00-29.00
Clean auto cast	44.00-45.00
Drop broken machinery	53.00-54.00

### Railroad Scrap

No. 1 R.R. heavy melt.	36.00-37.00
Rails, 2 ft and under	56.00-57.00
Rails, 18 in. and under	57.00-58.00
Angles, splice bars	50.00-51.00
Rails, rerolling	56.00-57.00

### Stainless Steel Scrap

18-8 bundles & solids	210.00-215.00
18-8 turnings	115.00-120.00
430 bundles & solids	95.00-100.00
430 turnings	65.00-70.00

## CLEVELAND

No. 1 heavy melting	29.00-30.00
No. 2 heavy melting	23.00-24.00
No. 1 factory bundles	32.00-33.00
No. 1 bundles	29.00-30.00
No. 2 bundles	20.00-21.00
No. 1 busheling	29.00-30.00
Machine shop turnings	12.00-13.00
Short shovel turnings	16.00-17.00
Mixed borings, turnings	16.00-17.00
Cast iron borings	16.00-17.00
Cut foundry steel	34.00-35.00
Cut structurals, plates	
2 ft and under	36.00-37.00
Low phos. punchings & plate	30.00-31.00
Alloy free, short shovel turnings	22.00-23.00
Electric furnace bundles	30.00-31.00

### Cast Iron Grades

No. 1 cupola	39.00-40.00
Charging box cast	34.00-35.00
Heavy breakable cast	30.00-31.00
Stove plate	37.00-38.00

**LOGEMANN**

## LOGEMANN Metal Balers

**... powerful ... compact ... capable  
of high tonnage output!**

In the large stamping plants and rolling mills where it is critically important that trim and stamping skeletons are quickly disposed of to avoid interference with production, LOGEMANN metal balers are relied on to keep ahead of production and pack such scrap into high density, self-cohering bricks for re-melting.

Hundreds of installations have established new records for tonnage, minimum maintenance, reliability, over extended periods of uninterrupted operation at high-speed.

LOGEMANN models are not confined to the large sizes. Many small plants have found it profitable to use smaller sizes embodying the same features of reliability, at minimum operating cost. Interested parties are invited to write for details. Information as to the character of the scrap, tonnage to be handled in a given period of hours, and range of gauges is helpful in determining the proper model.

### HYDRAULIC VALVES

The illustration shows a close-coupled hydraulic valve, operated by compressed-air cylinders for high-speed distribution of large gallonage of fluid at high pressure. LOGEMANN engineers have designed and built valves for many unusual as well as standard applications, and will welcome inquiries, with an outline of the conditions and requirements.

### HYDRAULIC PUMPS

The opposed-cylinder close-coupled double pressure pump shown in the illustration is mounted on an individual tank to conserve floor space under present crowded plant and operating conditions. When requesting details, please indicate the nature of the service, pressure and gallonage requirements, and the fluid to be handled.

# Aluminum Exports To Rise

Major producers see development of foreign markets as one solution to pepping up sales. Magnesium ingot production to set record this year. Some price slashing in zinc reported

Nonferrous Metal Prices, Pages 186 & 187

DOMESTIC producers of aluminum are casting an appraising eye at the foreign market as a potential outlet for the industry's increasing production.

Primary producers have not exploited the foreign market for two reasons: 1. Domestic demand has taken almost all its production. 2. Exports have been restricted by the government.

For the first time in its history, the domestic industry is producing more metal than it can sell. The expanding industrial capacity of other nations offers one solution to the disposal of surplus stocks, many industry people believe.

**Example—Reynolds Metals Co.** recently formed an export subsidiary (Reynolds International Inc.) to handle its manufacturing and sales activities outside the U. S. Reynolds has plants in seven countries, plus tie-ups with local producers and fabricators in several other overseas areas. Recent developments: 1. Formation of an Australian subsidiary. 2. Partnership in an Irish aluminum foil mill. 3. Formation of an aluminum manufacturing and sales company in the United Kingdom. 4. Joint ownership in a West German tube mill.

**Kaiser Aluminum & Chemical Corp.** sees a future in exports, too, even though they account for only about 1 per cent of sales now. Kaiser's foreign sales setup differs from Reynolds' in that it works through independent agents rather than subsidiary companies. But Ray G. Boyd, general manager of Kaiser's International Div., say it's quite possible that foreign offices will be opened later.

Aluminum Co. of America plans to step up its export program in view of increasing demand from overseas. Alcoa has affiliated

fabricating companies in Mexico and Venezuela. It also has sales representation in about 20 other countries, mostly by independent manufacturers' agents.

**Where—**Latin America offers the biggest potential for exports, Kaiser believes. "Western Europe also will be an important market

\*Estimated by STEEL.

Source: Defense Council of the Ingot Brass & Bronze Industry.

area, and the Far East, Near East, and Africa are developing rapidly as consumers of aluminum in all forms," says Mr. Boyd. Alcoa sees the greatest potential in Latin America and Europe, says John Wilson, export division manager.

What products will be in greatest demand overseas?

Says Mr. Boyd: "In growing industrial areas, there's an excellent market for fabricated items like electric conductor cable. In more established industrial regions, like Europe, our best opportunity is in the sale of primary metal." Alcoa believes sheets, pig, and cable will be in greatest demand.

## Mag To Set Record

Magnesium ingot production in 1957 will be the highest in any peacetime year. Monthly totals are running well ahead of 1956's. In the first nine months of this year, 61,118 tons were produced, compared with 46,573 tons in the same period of 1956. Total production this year should hit 80,000 tons, says the Magnesium Association, New York.

The outlook's not too bright in other areas. Fabricators are just about holding their own with last year's pace. Castings may be as much as 10 per cent below the 1956 figure by yearend.

## Aluminum Forecasts

Aluminum shipments in 1958 will increase 5 to 10 per cent over 1957's, predicts Donovan Wilmot, Aluminum Co. of America vice president. Mr. Wilmot also believes aluminum consumption this year will be about 5 per cent under the 1956 figure.

Alcoa's manager of distribution, H. T. Wilder, predicts domestic consumption will double by 1965 (STEEL estimates 1957 consumption in the U. S. at around 2 million tons). The forecast is backed

## NONFERROUS PRICE RECORD

Quotations in cents per pound based on: COPPER, deld. Conn. Valley; LEAD, common grade, deld. St. Louis; ZINC, prime western, E. St. Louis; TIN, Straits, deld. New York; NICKEL, electrolytic cathodes, 99.9%, base size at refinery, unpacked; ALUMINUM, primary pig, 99.5+%, deld.; MAGNESIUM, pig, 99.8%, Velasco, Tex.

by a University of Illinois professor, James E. Rosenzweig, who sees 1965 consumption at 4.2 million tons. Professor Rosenzweig breaks down major uses in 1965 like this: Building materials, 1 million tons; transportation equipment, 750,000 tons; direct military uses, 400,000 tons; consumer durable goods, 350,000 tons; electrical applications, 350,000 tons; containers and packaging, 250,000 tons.

## Tariff Loophole

The U. S. Tariff Commission is expected to act shortly to protect domestic lead and zinc producers from imports of pig lead and slab zinc by raising tariffs. But the anticipated action of the commission would give no additional protection against imports of fabricated products.

Foreign makers could still undersell American producers on such items as lead pipe, sheets, shot, wire, and babbitt, and zinc sheets and rolled products.

If the lead and zinc tariff is increased, look for a stepup in shipments of fabricated products from overseas producers.

## Zinc: Price Slashing

Rumors of price cutting by zinc producers continue. The zinc die-cast alloy grade is reported to be selling at 13.50 to 13.75 cents a pound. At the 13.50 cent level, it is only 1.75 cents a pound over the special high grade price (11.75 cents). Other zinc premiums are being hard pressed by imports and lack demand.

## Market Memos

Aluminium Ltd. has postponed part of its expansion program because of the slackoff in demand. Says Nathaniel V. Davis, president: "This latest adjustment in expansion plans is expected to reduce our capital expenditures by about \$30 million during 1958-59."

Anaconda Co. will acquire the Cochran Foil Co. of Louisville, manufacturer of aluminum foil.

The International Tin Council estimates 1957's surplus supply of tin will be about 12,500 tons.

November 11, 1957

## Cut costs on tough forming jobs with Elephant Brand<sup>®</sup> fine grain phosphor bronze

Automatic metal-forming machines operate best when they are fed materials of uniform, dependable quality. To shape critical details like those shown on these switch parts, many manufacturers rely on Seymour ELEPHANT BRAND phosphor bronze. Its fine grain permits making sharp bends, severe draws and other complex forming operations with a minimum of rejections or tooling adjustments.

Seymour ELEPHANT BRAND combines in one fine grain phosphor bronze alloy, high ductility, great strength, uniform temper, long fatigue life, and fine finish. These qualities prompt discerning users to say:—"Specify Seymour ELEPHANT BRAND . . . there's no finer phosphor bronze!"

**ALL  
ELEPHANT BRAND  
phosphor bronze  
is fine grain**

The first phosphor bronze produced in the U.S. was ELEPHANT BRAND. Made by a carefully guarded process which insures the highest degree of purity and uniformity, it has a grain structure of very fine, uniform crystals free from segregation, coring or residual dendritic structure. Thus, ELEPHANT BRAND is a quality standard as well as a trade-mark for the original and finest phosphor bronze.

Your Seymour Representative is trained to help you solve metals problems. Why not call him today?

**THE SEYMOUR MANUFACTURING COMPANY**

3 FRANKLIN ST., SEYMOUR, CONNECTICUT

# Nonferrous Metals

Cents per pound, carlots except as otherwise noted.

## PRIMARY METALS AND ALLOYS

**Aluminum:** 99.5%, pigs, 26.00; ingots, 28.10, 10,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

**Aluminum Alloy:** No. 13, 29.90; No. 43, 29.70; No. 195, 31.30; No. 241, 31.50; No. 356, 29.90, 30-lb ingots.

**Antimony:** R.M.M. brand, 99.5%, 33.00; Lone Star brand, 33.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 27.50-28.00, New York, duty paid, 10,000 lb or more.

**Beryllium:** 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

**Beryllium Aluminum:** 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

**Beryllium Copper:** 3.75-4.25% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment data, f.o.b. shipping point.

**Bismuth:** \$2.25 per ton, ton lots.

**Cadmium:** Sticks and bars, \$1.70 per lb deld.

**Cobalt:** 97-99%, \$2.00 per lb for 550-lb keg; \$2.02 per lb for 100 lb case; \$2.07 per lb under 100 lb.

**Columbium:** Powder, \$120 per lb, nom.

**Copper:** Electrolytic, 27.00 deld.; custom smelters, 25.50-26.00; lake, 27.00 deld.; fire refined, 26.75 deld.

**Germanium:** First reduction, \$179.17-197.31 per lb; intrinsic grade, \$197.31-220 per lb, depending on quantity.

**Gold:** U. S. Treasury, \$35 per oz.

**Indium:** 99.9%, \$2.25 per troy oz.

**Iridium:** \$86-110 nom. per troy oz.

**Lead:** Common, 13.30; chemical, 13.40; corroding, 13.40, St. Louis. New York basis, add 0.20.

**Lithium:** 98 + %, 50-100 lb, cups or ingots \$12; rod, \$15; shot or wire, \$16. 100-500 lb, cups or ingots, \$10.50; rod, \$14; shot or wire, \$15, f.o.b. Minneapolis.

**Magnesium:** Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

**Magnesium Alloys:** AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, AZ91C (sand casting), 40.75, f.o.b. Velasco, Tex.

**Mercury:** Open market, spot, New York, \$230-233 per 76-lb flask.

**Molybdenum:** Unalloyed, turned extrusions, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

**Nickel:** Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 78.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "F" nickel 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 1.01. Nickel oxide sinter, 71.25 per lb of nickel content before 1 cent freight allowance, f.o.b. Copper Cliff, Ont.

**Osmium:** \$80-100 per troy oz nom.

**Palladium:** \$21-24 per troy oz.

**Platinum:** \$81-87 per troy oz from refineries.

**Radium:** \$16-21.50 per mg radium content, depending on quantity.

**Rhodium:** \$118-125 per troy oz.

**Ruthenium:** \$45-55 per troy oz.

**Selenium:** \$10.50 per lb, commercial grade.

**Silver:** Open market, 90.625 per troy oz.

**Sodium:** 16.50, c.l.; 17.00 l.c.l.

**Tantalum:** Rod, \$60 per lb; sheet, \$55 per lb.

**Tellurium:** \$1.65-1.85 per lb.

**Thallium:** \$12.50 per lb.

**Tin:** Straits, N. Y., spot and prompt, 89.50.

**Titanium:** Sponge, 99.3+%, grade A-1 ductile (0.3% Fe max.), \$2.25; grade A-2 (0.5% Fe max.), \$2.00 per lb.

**Tungsten:** Powder, 98.8%, carbon reduced, 1000-lb lots, \$3.50 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99+ % hydrogen reduced, \$4.10-4.20.

**Zinc:** Prime Western, 10.90; brass special, 10.25; intermediate, 10.50, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 11.35; special high grade, 11.75 deld. Die casting alloy ingot No. 3, 14.25; No. 2, 15.25; No. 5, 14.75 deld.

**Zirconium:** Sponge, commercial grade, \$5-10 per lb.

(Note: Chromium, manganese, and silicon metals are listed in ferroalloy section.)

## SECONDARY METALS AND ALLOYS

**Aluminum Ingot:** Piston alloys, 23.75-30.25; No. 12 foundry alloy (No. 2 grade), 21.75-23.00; 5% silicon alloy, 0.60 Cu max., 25.50-26.00; 13 alloy, 0.60 Cu max., 25.50-26.00; 195 alloy, 24.75-26.75; 108 alloy, 22.25-23.00. Steel deoxidizing grades, notch bars, granulated or shot; Grade 1, 23.75; grade 2, 22.00; grade 3, 20.75; grade 4, 19.00.

**Brass Ingot:** Red brass, No. 115, 26.75; tin bronze, No. 225, 36.00; No. 245, 30.25; high-leaded tin bronze, No. 305, 30.75; No. 1 yellow, No. 405, 22.00; manganese bronze, No. 421, 24.50.

**Magnesium Alloy Ingot:** AZ63A, 40.75; AZ91B, 37.25; AZ91C, 40.75; AZ92A, 40.75.

## NONFERROUS PRODUCTS

### BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.82, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.80, f.o.b. Temple, Pa.

### COPPER WIRE

Bare, soft, f.o.b. eastern mills, 30,000-lb lots, 32.355; l.c.l., 32.98. Weatherproof, 30,000-lb lots, 33.66; l.c.l., 34.78. Magnet wire deld., 40.43, before quantity discounts.

### LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$19.00 per cwt; pipe, full coils, \$19.00 per cwt; traps and bends, list prices plus 30%.

### TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheets and strip, \$9.50-15.95; sheared mill plate, \$8.00-11.50; wire, \$7.50-11.50; forging billets, \$6.00-7.60; hot-rolled and forged bars, \$6.15-7.90.

### ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 24.00; ribbon zinc in coils, 20.50; plates 19.00.

### ZIRCONIUM

Plate, \$12.50-19.20; H.R. strip, \$12.50-22.90; C.R. strip, \$15.00-31.25; forged or H.R. bars, \$11.00-17.40.

quantities)

##### ANODES

admium: Special or patented shapes, \$1.70  
er lb.

opper: Flat-rolled, 45.29; oval, 43.50, 5000-  
0,000 lb; electrodeposited, 35.75, 2000-5000  
b lots; cast, 36.25, 5000-10,000 lb quantities.

ickel: Depolarized, less than 100 lb, 114.25;  
00-499 lb, 112.00; 500-4999 lb, 107.50; 5000-  
9,999 lb, 105.25; 30,000 lb, 103.00. Carbonized,  
educt 3 cents a lb.

in: Bar or slab, less than 200 lb, 108.5; 200-  
99 lb, 107.00; 500-999 lb, 106.50; 1000 lb or  
ore, 106.00.

zinc: Balls, 17.50; flat tops, 17.50; flats,  
9.25; ovals, 18.50, ton lots.

##### CHEMICALS

Cadmium Oxide: \$1.70 per lb in 100-lb drums.  
hromic Acid: 100 lb, 33.30; 500 lb, 32.80;  
2,000 lb, 32.15; 5000 lb, 31.80; 10,000 lb, 31.30;  
o.b. Detroit.

Copper Cyanide: 100-200 lb, 71.60; 300-900  
b, 69.60.

Copper Sulphate: 100-1900 lb, 14.55; 2000-5900  
b, 12.55; 6000-11,900 lb, 12.30; 12,000-22,900  
b, 12.05; 23,000 lb or more, 11.55.

Nickel Chloride: Less than 400 lb, 35.00; 400-  
9990 lb, 33.00; 10,000 lb, 32.50.

Nickel Sulphate: 5000-22,000 lb, 33.50; 23,000-  
35,900 lb, 33.00; 36,000 lb or more, 32.50.

Sodium Cyanide: 100 lb, 27.60; 200 lb, 25.90;  
400 lb, 22.90; 1000 lb, 21.90; f.o.b. Detroit.

Sodium Stannate: Less than 100 lb, 73.20; 100-  
500 lb, 64.20; 700-1900 lb, 61.50; 2000-9900 lb,  
59.60; 10,000 lb or more, 58.30.

Stannous Chloride (anhydrous): Less than 25  
lb, 162.20; 25 lb, 127.20; 100 lb, 112.20; 400  
lb, 109.80; 5200-19,600 lb, 97.60; 20,000 lb or  
more, 85.40.

Stannous Sulphate: Less than 50 lb, 125.20; 50  
lb, 95.20; 100-1900 lb, 93.20; 2000 lb or more,  
91.20.

Zinc Cyanide: 100-200 lb, 59.00; 300-900 lb,  
37.00.

## STEEL PLANT ENGINEER

A graduate Mechanical Engineer  
is needed to fill a permanent posi-  
tion in our Plant Engineering De-  
partment at Fontana.

This opportunity is available for  
an outstanding engineer whose  
experience includes the design,  
maintenance, construction and lay-  
out of rolling mills and steel mak-  
ing facilities.

If your qualifications meet these  
requirements, send complete  
resume with salary requirements  
to

### Help Wanted

#### CLEANING ROOM SUPERINTENDENT:

Must have supervisory experience and be com-  
pletely familiar with all phases of cleaning room  
operations for a miscellaneous steel jobbing  
foundry producing castings up to 10,000 pounds.  
Excellent opportunity for an aggressive qualified  
man with a modern and progressive foundry  
located in the Middle West producing 600-700  
tons per month. Advise full particulars including  
salary requirements, Box 603, STEEL, Penton  
Bldg., Cleveland 13, Ohio.

PRINCIPAL CORROSION ENGINEER: Study  
of the fundamentals of corrosion relating to  
ferrous metal in environmental media of liquid  
metals, aqueous solutions and gases. Applicant  
should be Ph. D. grade or 3 to 5 years experi-  
ence in corrosion technology. Salary commensu-  
rate with ability. Located Western Pennsylvania.  
Replies confidential. Reply Box 615, STEEL,  
Penton Bldg., Cleveland 13, Ohio.

METALLURGIST: HIGH TEMPERATURE RE-  
SEARCH. Opening for Research Metallurgist  
with experience in elevated temperature field.  
Basic research and evaluation of high tempera-  
ture alloys. Many fringe benefits including op-  
portunity for additional university training. Lo-  
cation research institute Western Pennsylvania.  
All replies confidential. Reply Box 614, STEEL,  
Penton Bldg., Cleveland 13, Ohio.

PHYSICIST: Ph. D. or equivalent with mag-  
netic and metallurgical interest and experience  
in either alloy or powder and sintered magnets.  
Long term research. Location Western Pennsylv-  
ania. Salary commensurate with ability. Reply  
Box 616, STEEL, Penton Bldg., Cleveland 13,  
Ohio.

PHYSICIST: Ph. D. or equivalent. Primary  
interest in X-ray diffraction. Long range study  
of preferred orientation of polycrystalline ma-  
terials. Location Western Pennsylvania. Reply  
Box 617, STEEL, Penton Bldg., Cleveland 13,  
Ohio.

MAKERS OF THE FAMOUS FEMCO TROLLEYPHONE

(Concluded from Page 181)

representative orders for some time past, and dealers think there will be none for some time to come.

**Cincinnati**—Prices on the principal steelmaking grades dropped \$3 a ton last week, but some limited mill buying was reported. No. 1 heavy melting dipped \$3 to \$30-\$31, brokers' buying price.

**Detroit**—Scrap prices are down, and may go still lower. Some juggling of quotations is going on, but lack of purchases makes current market activity a guessing game among dealers and brokers.

The last bids were not split, and most of the bundles sold on October lists apparently are scheduled for water shipment to Bethlehem Steel Co.'s Lackawanna (N. Y.) plant.

**Buffalo**—Scrap prices declined as much as \$5.50 a ton last week on new mill orders for November delivery. A leading consumer paid \$30 for No. 2 heavy melting, off \$5.50, and \$28 for No. 2 bundles, down \$4.50. No. 1 heavy melting fell to \$32-\$33, down \$4.

Blast furnace scrap was cut as much as \$3. Other specialties also declined, including low phos at \$38, random rails at \$45, and railroad specialties at \$38. Cast scrap dropped \$1.

**Birmingham** — Except for the cast iron grades, there is little scrap moving here. Only nominal orders for cast are being received. Brokers attribute the small volume to production cutbacks and large inventories. Some dealers with high-priced inventories are refusing to sell at current prices.

**Seattle** — Scrap continues depressed. Sales are lacking and current prices are nominal. Receipts are light. The export market is quiet. Japanese importers are reported planning a meeting at which they will consider future buying policy. At present Japan needs scrap but lacks adequate credit.

**Los Angeles**—The scrap market undertone is soft, but prices are holding at the recently reduced level. Mill purchases are practically nil and export business is at a standstill.

**San Francisco** — Steel scrap prices are expected to fall an average of \$2 a ton when the mills make new postings shortly.
